2018

FOREWORD

The World Ozone Day offers an opportunity to focus global attention and action on the vital environmental issue of Protection of the Ozone Layer and the need for all to work consistently under the aegis of the Montreal Protocol to phase out ozone depleting substances. The Montreal Protocol on Substances that Deplete the Ozone Layer has been recognized as the most successful international environment treaty in history. The implementation of the Protocol has led to complete phase-out of production and consumption of several Ozone Depleting Substances (ODSs) CFCs, CTC halons, Methyl Chloroform and Methyl Bromide have already been phased out globally.

The actions under the Montreal Protocol demonstrate that science, supplemented with consensus-based policies and actions with active participation of the industry, have proven to be an example of excellent international cooperation, leading to not only the phase-out of production and consumption of several ODSs, but also towards protection of the global climate system.

India has played a proactive role in the implementation of ODS phase-out activities in the country and has also contributed to the development of the Protocol. More recently played an important role in adoption of the historic Kigali Amendment to the Montreal Protocol. Important initiatives have been taken by the Ministry last year. The Ministry of Environment Forest and Climate Change and the Ministry of Skill Development and Entrepreneurship, Government of India, signed a Memorandum of Understanding to train 100,000 Refrigeration and Air-conditioning service technicians in good servicing practices and the new alternative refrigerants under the Pradhan Mantri Kaushal Vikas Yojana (PMKVY) – Skill India Mission. This training of RAC service technicians has positive impact on environment in terms of reduced refrigerant leakages and better performance of in-use air conditioning equipment and on the livelihood opportunities of the service technicians.

A Cooling Action Plan for the country is also being developed to address the cooling requirement across sectors over the period of next 20-years, with a focus on sustainable cooling and thermal comfort for all, skill development, and development of an R&D ecosystem to support energy efficient and new/alternative cooling technologies. The draft of the India Cooling Action Plan will be released on the occasion of World ozone Day 2018 for obtaining comments and suggestions of all concerned. The Ministry has also actively engaged with all concerned stakeholders through a series of interactive meetings and workshops.

The World Ozone Day 2018 is being celebrated globally with the theme “**Keep Cool and Carry On**”. On the occasion of the 24th World Ozone Day, India reiterates its commitment to protect the Ozone layer.

Date: 14.09.2018

(Dr. Harsh Vardhan)

1. OZONE LAYER

The small blue and green planet we call home is a very special and unique place. We live on the only planet in our solar system and possibly in the galaxy, where life is known to exist. All life exists within thin film of air, water, and soil. This spherical shell of life is known as the biosphere. The biosphere can be divided into three layers; the atmosphere (air), the hydrosphere (water), and the lithosphere (rock and soil). It is the unique attribute of the Earth's atmosphere that allows it to be a habitable place for humans, animals, microbes and plants, as we know them.

The atmosphere is a mixture of gases and particles that surround our planet. When seen from space, the atmosphere appears as a thin seam of dark blue light on a curved horizon.

The Earth's atmosphere is divided into several layers. The lowest region, the troposphere, extends from the Earth's surface up to about 10 to 15 kilometres (km) in altitude. The height of the Mount Everest is only about 9 km. Virtually, most of the human activities affects the troposphere. The next layer, the stratosphere, continues from 10 km to about 50 km.

Earth's Atmospheric Layers

Concentration of Ozone in the Atmosphere

Ozone is a tri-atomic molecule of oxygen instead of normal two. It is formed from oxygen naturally in the upper levels of the Earth's atmosphere by high-energy ultraviolet (UV) radiation from the Sun. The radiation breaks down oxygen molecules, releasing free atoms, some of which bond with other oxygen molecules to form ozone.

Stratospheric Ozone Production

About 90 per cent of all ozone formed in this way lies between 10 km and 50 km above the Earth's surface - this part of the atmosphere is called the stratosphere. Hence, this is known as the 'Ozone Layer'. Even in the ozone layer, ozone is present in very small quantities; its maximum concentration, at a height of about 17-25 km, is only ten parts per million. The ozone layer was discovered in 1913 by the French physicists Charles Fabry and Henri Buisson.

Since solar radiation is the strongest over the tropics, the global ozone is formed in tropics. However, strong solar radiation also causes rise of air to high altitudes and ozone is transported away from the equator towards the poles where it accumulates in the cold sub

polar regions. At the equatorial region formation and photochemical depletion of ozone take place simultaneously and ozone cannot accumulate in this region. In the polar region there is accumulation of ozone because photochemical depletion is low and due to transport of ozone from equator. Therefore, in winter the highest ozone values are observed over the Polar regions as long as there is no other disturbing influence.

Total ozone at any point from Earth's surface to Stratosphere is quantified in Dobson Units (DU). One hundred DU equals the quantity of ozone that would form a layer of 1mm thick at sea level if compressed at Standard Temperature and Pressure (STP).

Typical distribution of ozone is about 240 DU near the equator with a maximum of 440 DU during early spring at high latitudes in the Arctic and 360 DU in the Antarctic. When the concentration of ozone, over any area, falls below 220 DU, we call it Ozone Hole.

Ozone is an unstable molecule. High-energy radiation from the Sun not only creates ozone, but also breaks it to oxygen, recreating molecular oxygen and free oxygen atoms. The concentration of ozone in the atmosphere depends on a dynamic balance between creation and destruction of ozone.

Concentration of Ozone in Atmosphere

Good and Bad Ozone

"Good" ozone is produced naturally in the Stratosphere and is good because it blocks harmful UV radiations from reaching the Earth's surface.

Ozone is also present in the lower levels of the atmosphere (i.e. the troposphere), but in very lower concentrations than in the stratosphere. Close to the Earth's surface, most of the Sun's high-energy UV radiation has already been filtered out by the stratospheric ozone layer and therefore the main natural mechanism for ozone formation does not take place in the troposphere.

However, elevated concentrations of ozone at ground level are found in some regions, mainly as a result of pollution. Burning of fossil fuels and biomass releases compounds such as nitrogen oxides and volatile organic compounds, usually found in car exhausts, which react with sunlight to form peroxy intermediates, which catalyses to form ozone. This is "bad" ozone. Bad ozone is an air pollutant and is bad because it is harmful to breathe and can damage crops, trees, other vegetation, plastics, rubbers etc.. Ground level ozone is a main component of urban smog.

There is little connection between ground level ozone and the stratospheric ozone layer.

UV Protection by the Ozone Layer

Whereas the stratospheric ozone shields the Earth from the Sun's harmful rays, the ground level ozone is a pollutant. Ozone, formed due to pollution at the Earth's surface, cannot replenish the ozone layer. In addition, though ground level ozone absorbs some UV radiation, the effect is negligible.

Measurement of Ozone in the Atmosphere

Ozone is spread from the surface of Earth upto the top of stratosphere, 50 km as a very thin layer. The question often asked is how is the concentration of ozone in this thin layer is measured and quantified with a reasonable accuracy.

Atmospheric ozone is measured both by remote sensing and by in-situ techniques.

Generally, the following three characteristics of atmospheric ozone are routinely measured by various monitoring systems:

(a) Surface Ozone (b) Total Ozone over an area and (c) The vertical profile of Ozone.

Surface ozone is generally measured by in-situ techniques using optical, chemical or electro chemical methods. The most convenient method is the optical method which depends upon the strong absorption of UV light at 254 nanometer (nm). The absorption is measured in a UV cell at 254 nm against another cell containing air free from ozone. By comparing the two irradiation signals, it is possible to determine the concentration of ozone from 1 to 1000 parts per trillion (ppt) by volume.

Total ozone is measured by remote sensing methods using ground based instruments, measuring the intensity of absorption spectrum of ozone between 300 and 340 nm using direct sun or direct full moon light and satellite based instruments, measuring the solar UV radiation scattered back to space by the Earth's atmosphere. The most commonly ground based instruments used by World Meteorological Organization (WMO) global ozone network are the Dobson and Brewer Spectrophotometers.

The most accurate and the best defined method for determining total ozone is to measure direct solar radiation from ground at UV wave bands between 305 and 340 nm.

Dobson instrument measures spectral intensities at three wave length pairs and the Brewer spectrophotometer at five operational wavelengths. Moon light as a source of UV radiation can also be used, but the accuracy is reduced due to lower intensity of light. For accuracy and comparison, all spectrometers are calibrated regularly at National Oceanic and Atmospheric Administration (NOAA) subtropical high altitude observatory at Mauna Loa, Hawaii where other interfering air pollutants like Sulfur dioxide (SO₂), Nitrous Oxide (NO_x), aerosols etc. are absent.

Vertical profile of ozone is measured with (a) Ozonesondes (b) Ground-based Dobson and Brewer Spectrophotometers using light from zenith sky during twilight using the Umkher inversion method and (c) laser radars (Light Detection and Ranging (LIDAR)).

Ozonesondes measure the concentration of ozone as a function of height by a wet chemical method (ozone liberating iodine when bubbled through potassium iodide solution and measured electro chemically) during its balloon borne ascent to an altitude of about 35 km (mid stratosphere). They operate regularly in all climatic regions and have been the backbone of ozone profiling since 1960.

The latest method of vertical profiling of ozone is the LIDAR system in which a short laser pulse at a wave length in the UV ozone absorption spectrum is sent towards the zenith. Back scattered radiation is measured as a function of time which gives the height and its intensity gives the concentration of ozone. Two wave-lengths are used, one of which is absorbed by ozone, and the other is not which serves as a reference. The concentration of ozone measured at different heights thus gives the vertical profile.

Ozone Measurement over India

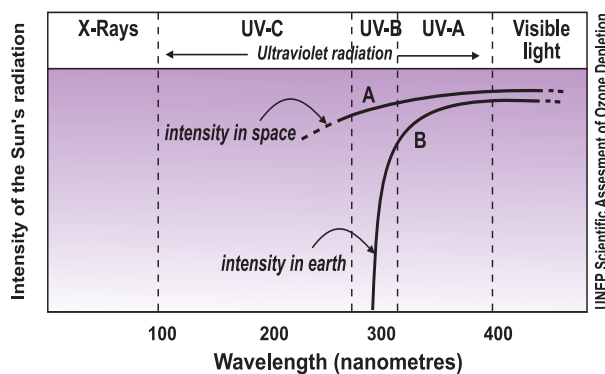

Indian Meteorological Department (IMD) is the nodal agency to measure the ozone levels in India. IMD has established a National Ozone Centre. The centre maintains and control a network of Ozone Monitoring Stations located at New Delhi, Ranichauri, Guwahati, Nagpur, Pune, Kodaikanal, Thiruvananthapuram, Vanarasi, Port Blair and Maitri (Antarctica). The ozone data measured is regularly sent to World Ozone Data Centre, Canada.

What is UV Radiation?

The Sun emits radiations of varying wavelengths in the form of electromagnetic spectrum. The UV radiation is one form of radiant energy coming out from the Sun. The various forms of energy, or radiations, are classified according to wavelength measured in nm. The shorter the wavelength, the radiation are more energetic. In order of decreasing energy, the principal forms of radiation are gamma rays, X-rays, UV rays, visible light, infrared rays, microwaves, and radio waves. The UV radiation, which is invisible, is so named because of its wavelengths are less than those of visible violet radiations.

Of these, UV-B and UV-C being highly energetic, are harmful to life on Earth. UV-A radiation being less energetic is relatively less harmful. Fortunately, UV-C radiation is absorbed strongly by oxygen and also by ozone in the upper atmosphere. UV-B radiation is absorbed only by the stratospheric ozone (ozone layer) and thus only 2-3% of it reaches the Earth's surface. The ozone layer, therefore, is essential for protection of life on the Earth by filtering out the dangerous part of Sun's radiation and allowing only the beneficial part to reach Earth. Any disturbance or depletion of this layer would result in an increase of UV-B and UV-C radiation reaching the Earth's surface leading to dangerous consequences for the life on Earth. The ozone layer, therefore, acts as Earth's sunscreen.

Range of Wavelengths of UV Radiations

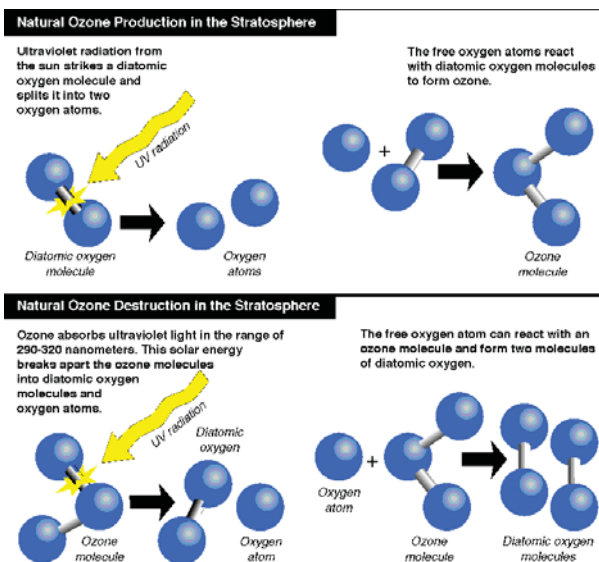

A - Undisturbed Ozone Layer
B - Disturbed Ozone Layer

Ozone Depletion

At any given time, ozone molecules are constantly formed and destroyed in the stratosphere. The total amount, however, remains relatively stable. The dynamic equilibrium between creating and breaking down ozone molecules depends on temperature, pressure, energetic conditions and molecule concentrations. The concentration of the ozone layer can be thought of as a stream's depth at a particular location. Although, water is constantly flowing in and out, the depth remains constant.

Natural Formation and destruction of Ozone

The concentrations of ozone vary naturally with sunspots, seasons, and latitudes. The processes of variation of ozone are well understood and

predictable. Scientists have established records for several decades which show distribution of ozone during the natural cycles. It has been observed that each natural reduction in ozone levels has been followed by a recovery cycle. However, convincing scientific evidences have shown that the ozone layer is being depleted well beyond changes due to natural processes.

Ozone depletion occurs when the natural balance between the production and destruction of stratospheric ozone is shifted towards destruction. The equilibrium can be disturbed for instance by other molecules which react with the ozone molecules, and thereby destroying them. If this destruction process is fast and the creation of new molecules is too slow to replace the destroyed ozone molecules, the equilibrium will get out of balance. As a result, the concentration of ozone molecules will be reduced. An upset in this balance can have serious consequences for life on Earth, and scientists are finding evidence of the changed balance. As a result, the concentration of ozone within the protective ozone shield is decreasing.

complex series of catalytic reactions leading to destruction of ozone.

Process of destruction of ozone

Large fires, certain types of marine life and volcanic eruptions also produce chlorine molecules. These are chemically active but most of it gets converted into water soluble inorganic compounds which gets washed down by rain and only traces reach the stratosphere. However, United States Environment Protection Agency (USEPA) experiments have shown that Chlorofluorocarbons (CFCs) and other widely used chemicals produce roughly 85% of the chlorine in the stratosphere.

It was also believed that large volcanic eruptions can have an indirect effect on ozone levels. Although, Mt. Pinatubo's 1991 volcanic eruption did not increase stratospheric chlorine concentrations, it did produce large amount of tiny particles called aerosols. These aerosols increase chlorine's effectiveness in destroying ozone.

The aerosols only increase depletion because of the presence of CFC- based chlorine. In effect, the aerosols increase the efficiency of the CFC siphon, lowering ozone levels even more than that would have otherwise occurred. Unlike long-term ozone depletion, this effect is however short-lived. The aerosols from Mt. Pinatubo have already disappeared, but satellite, ground based, and balloon data still show ozone depletion occurring closer to the historic trend.

Reaction of Chlorine with Ozone

When very stable man-made chemicals containing chlorine and bromine enter into the atmosphere, and reach the stratosphere, these chemicals are broken down by the high energy solar UV radiation and release extremely reactive chlorine and bromine atoms. These undergo a

Beginning of Threat to Ozone Layer

For over fifty years, CFCs were thought of as miracle substances. CFCs were first created in 1928 as non-toxic, non-flammable refrigerants, and were first produced commercially in the 1930's by DuPont. The first Chlorofluorocarbon was CFC-12, a single carbon with two chlorines and two Fluorines attached to it.

These have been used in many ways since they were first synthesized in 1928. They are stable, inert, non-flammable, low in toxicity, and inexpensive to produce. Over the period, CFCs have been used as aerosols, refrigerants, solvents and foam blowing agents in other smaller applications. Other chlorine and bromine-containing compounds include methyl chloroform, a solvent, Carbontetrachloride (CTC), an industrial chemical, halons, extremely effective fire extinguishing agents, Hydrochlorofluorocarbons (HCFCs) mainly used as a refrigerant and foam blowing agent and methyl bromide, an effective fumigant used in agriculture and grain storage.

All of these compounds have very long atmospheric life which allow them to be transported by winds into the stratosphere.

During the past 5 decades, Ozone Depleting Substances (ODSs) including CFCs have been emitted into the atmosphere in large quantity which has resulted in depletion of the ozone layer resulting increased UV-B radiations on the Earth surface.

UV Radiations on Earth Surface

The largest losses of stratospheric ozone occur regularly over the Antarctica every spring, leading to substantial increase in UV levels over the region. A similar, though weaker, effect has been observed over the Arctic. There was enough evidence that ozone levels decrease by several percent in the spring and summer in both hemispheres at middle and high latitudes.

Status of Global Stratospheric Ozone : September, 2017

There is also fall in ozone levels during the winter at these latitudes in the southern hemisphere. The higher levels of loss of ozone have been noticed since late 1970s.

In the early 1970s, researchers began to investigate the effect of various chemicals on the ozone layer, particularly CFCs, which contain chlorine. They also examined the potential impacts of other chlorine sources like chlorine from chlorination of water, industrial plants, sea salt and volcanoes etc. The chlorine released from such applications and from other sources readily combines with water and other chemicals and form compounds which do not reach the stratosphere. In contrast, CFCs are very stable and do not dissolve in rain. Thus, there are no natural processes that remove the CFCs from the lower atmosphere. Over a period of time, the CFCs diffuse into the stratosphere where these interact with UV rays of short wave length which breaks them.

The CFCs are so stable that only exposure to

strong UV radiation breaks them. When that happens, the CFC molecule releases atomic chlorine. It has been estimated that one chlorine atom can destroy over 100,000 ozone molecules. The net effect is the destruction of ozone, faster than its natural creation. To return to the analogy comparing ozone levels to a stream's depth, CFCs act as a siphon, removing water faster than normal and reducing the depth of the stream.

No one could imagine that these miracle chemicals could one day turn out to be harmful substance to life on Earth. It all began when at the first United Nations on the Human Environment Conference at Stockholm in 1972, questions were asked about the effect of jet aircrafts on upper atmosphere. It was known that the high temperature jet exhausts contain an appreciable amount of nitrous oxide and it was also known that this substance can catalytically decompose ozone. The conference authorized United Nations Environment Programme (UNEP) to address this issue and focus on the possible damage to the ozone layer by hundreds of supersonic aircrafts that were expected to be in operation by the late 1980s. They were also entrusted with the task of finding out the effect of release of nitrous oxide from fertilizer manufacturing units on the ozone layer.

These investigations did not make much headway and were dismissed as false alarms.

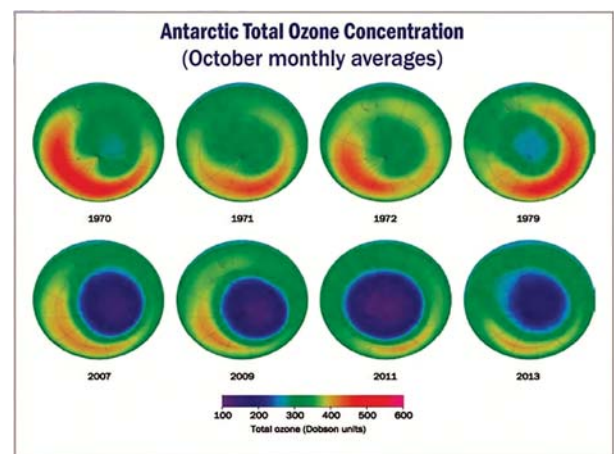

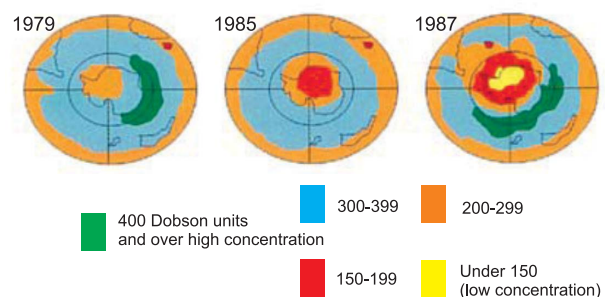

The Antarctic Ozone Hole

The term "ozone hole" refers to a large and rapid decrease in the concentration of ozone molecules in the ozone layer. "When the concentration of ozone over any area falls below 220 DU, it is called ozone hole". The Antarctic "Ozone Hole" occurs during the southern spring between September and November each year. The British Antarctic survey team first reported the hole in May 1985. The team found that for the period between September and mid November, ozone concentration over Halley Bay,

Antarctic, had declined by 40% from levels during the 1960s. Severe depletion has been occurring since late 1970s.

The problem is worst in this part of the globe due to extremely cold atmosphere and the presence of polar stratospheric clouds. The land under the ozone depleted atmosphere increased steadily to more than 20 million sq km in the early 1990s and in the Antarctic spring of 1998, the area of the ozone hole exceeded 26 million sq km and also covered some populated areas of the southern hemisphere. The total ozone dropped to about 97 DU on 1 October, 1998.

Evolution of the Antarctic Ozone hole (1979 - 1987 October)

Changes in Ozone concentration over Antarctica (1970-2013)

The Antarctic ozone hole grew to 28.4 million sq. km in 2000. In the year 2002, a peculiar effect was seen, the ozone hole split into two but the total coverage was only 15 million sq. km. In the year 2005, the size of ozone hole again increased to 27.0 million sq. km. The

ozone hole further grew to an extraordinary size, 29.3 million sq. km in 2006. The size of ozone hole slightly started declining and in 2008 became equivalent to the size of North America and NOAA reported that ozone hole reached to 26.5 million sq. km. in September, 2008. It was also observed that the total column of ozone dropped to its lowest count of 100 DU in September, 2008. The size of Antarctic ozone hole in September, 2009, September, 2010, September, 2011, September, 2012, September, 2013 and September, 2014 were reported to be 24 million sq. km., 22.2 million sq. km., 25 million sq. km., 18.5 million sq. km., 21 million sq. km. and 24.3 million sq. km. respectively.

The latest false-color view of total ozone over the Antarctic pole. The purple and blue colors are where there is the least ozone, and the yellows and reds are where there is more ozone.

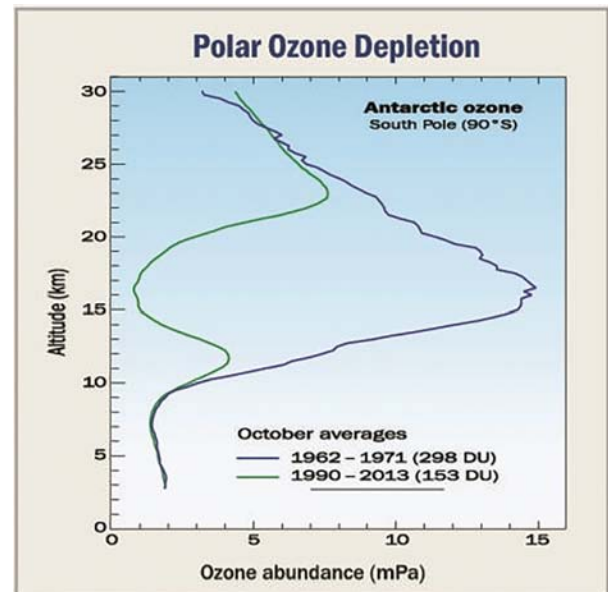

This indicates that the Montreal Protocol is working effectively and there is a gradual recovery of ozone layer.

The decline of ozone layer over North Pole has also been reported. The effect has been ascribed to solar flares and record frigid temperatures working with manmade chemicals.

In addition, research has shown that ozone depletion occurs over the latitudes that include

North America, Europe, Asia, and much of Africa, Australia and South America. Thus, ozone depletion is a global issue and not just a problem at the South Pole. It was also reported that some ozone depletion also occurs in the Arctic during the Northern Hemisphere spring (March-May). Wintertime temperatures in the Arctic stratosphere are not persistently low for many weeks and these results in less ozone depletion.

Recent observations and several studies have shown that the size of annual ozone hole has stabilized and the level of ODSs has decreased by 4 percent since 2001. But chlorine and bromine compounds have long atmospheric life. Recovery of stratospheric ozone is not likely to be noticeable until 2020 or little later.

Environmental Effects of Ozone Depletion

As explained earlier, ozone acts as a shield to protect the Earth's surface by absorbing harmful UV-B and UV-C radiation. If this ozone is depleted, then more UV rays will reach the earth surface. Exposure to higher doses of UV-B radiations will have effects on human health and impact on flora and fauna of terrestrial as well as aquatic eco-systems.

- **Human health effects:**

- ☐ Sunburns, premature ageing of the skin.

- ❑ UV radiation can damage several parts of the eye, including the lens, cornea, retina and conjunctiva.
- ❑ As per World Health Organization (WHO), 2002 report, a 10% decrease in stratospheric ozone could cause an additional 300,000 non-melanoma and 4500 melanoma skin cancers in the world.
- ❑ More cataracts leading to damage to the eye vision resulting in blindness. Cataracts (a clouding of the lens) are the major cause of blindness in the world. Ten percent thinning of the ozone layer could cause 1.6 to 1.75 million more cases of cataracts worldwide every year (WHO, 2002).
- ❑ Early findings suggest that exposure to UV radiation results in suppression of the human immune system, which may cause non-melanoma and skin cancer.

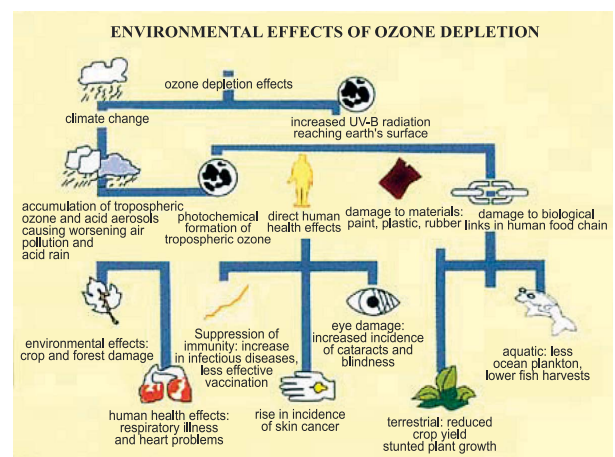

● Adverse impact on agriculture, forestry and natural ecosystems:

- ❑ Several of the world's major crop species are particularly vulnerable to increased UV radiation, resulting in reduced growth, photosynthesis and flowering. Food production may reduce by about 1% for every 1% increase of UV-B radiation.
- ❑ The effect of ozone depletion on the agricultural sector could be significant. Many agricultural crops sensitive to the UV-B radiation of the Sun are rice, wheat, soybean, corn, sweet corn, barley, oats, cowpeas, peas, carrots, cauliflower, tomato, cucumber, broccoli etc.
- ❑ A few commercially important trees have been tested for UV-B radiation sensitivity. Results indicate that plant growth, especially in seedlings, is more vulnerable to intense UV radiation.
- **Damage to marine life:**
- ❑ Planktons are the first vital step in aquatic food chains. In particular, plankton (tiny organisms on the surface layer of oceans) is threatened by increased UV-B radiation.

- ❑ Decreases in plankton could disrupt the fresh and saltwater food chains, and lead to species shift.
- ❑ Marine fauna like fish lings, juvenile stages of shrimp and crab have been threatened in recent years by increasing UV-B radiation under the Antarctic region. Loss of biodiversity in oceans, rivers and lakes could impact on aquaculture prospects.

● Materials:

- ❑ Wood, plastic, rubber, fabrics and many construction materials are degraded by UV-B radiation.
- ❑ The economic impact of replacing and/or protecting materials could be significant.

The Real Alarm

In 1974, two United States (US) scientists Mario Molina and F. Sherwood Rowland at the University of California were struck by the observation of a British scientist, James Lovelock that CFCs were present in the atmosphere all over the world more or less evenly distributed by appreciable concentrations. They suggested that these stable CFC molecules could drift slowly up to the stratosphere where they may breakdown into chlorine atoms by energetic UV-B and UV-C radiations of the Sun. The chlorine radicals thus produced can undergo complex chemical reaction producing chlorine monoxide, which can attack an ozone molecule converting it into oxygen and in the process regenerating the

chlorine atom again. Thus, the ozone-destroying effect is catalytic and a small amount of CFCs would be destroying large number of ozone molecules. Their basic theory was put to test by the National Aeronautics and Space Administration (NASA) scientists and found to be valid, ringing alarm bells in many countries and laying the foundation for international action.

International Action

The first international action to focus attention on the dangers of ozone depletion in the stratosphere and its dangerous consequences in the long run on life on earth was initiated in 1977. A meeting of 32 countries in Washington D.C., USA initiated a Work Plan on action on protection of ozone layer with UNEP as the coordinator.

As experts began their investigation, data piled up and in 1985, in an article published in the prestigious science journal, "Nature" by Dr. Farman, pointed out that although, there is overall depletion of the ozone layer all over the world, the most severe depletion had taken place over the Antarctic. His findings were confirmed by Satellite observations and offered the first proof of severe depletion of ozone layer. These findings stirred the scientific community to take urgent remedial actions. A framework for such actions was designed and agreed in an international convention held in Vienna on 22nd March, 1985.

This, subsequently, resulted in an international agreement on 16th September, 1987 on specific measures to be taken in the form of an international treaty known as the Montreal Protocol on Substances that Deplete the Ozone Layer. Under this Protocol, the first concrete step to save the ozone layer was taken by immediately agreeing to completely phase out the production and consumption of CFCs, halons, CTC and methyl chloroform as per the agreed schedule by the Parties to the Montreal Protocol.

Evolution of the Montreal Protocol

The urgency of controlling the ODSs, particularly CFCs was slow to pick up. The CFCs were so useful that the society and the industry, all over the world, were reluctant to give up the use of CFCs. However, even as the nations adopted the Montreal Protocol in 1987, new scientific findings indicated that the Protocol's control measures were inadequate to restore the ozone layer. In addition, the developing countries had a special situation, as they needed the technical and financial assistance to enable these countries to change over to non-ODS technologies.

In response to the prospect of increasing ozone depletion, the governments of the world crafted the 1987 United Nations Montreal Protocol as an international means to address this global issue. As a result of the broad compliance with the Protocol and its Amendments and adjustments and, of great significance, industry's development of "ozone-friendly" substitutes for the now-controlled chemicals, the total global accumulation of ODSs has slowed and begun to decrease. In response, global ozone depletion is no longer increasing, and initial signs of recovery of the ozone layer have been identified. With continued compliance, we can expect substantial recovery of the ozone layer by the middle of the 21st century. The day the Montreal Protocol was agreed upon, 16 September, is now celebrated as the International Day for the Preservation of the Ozone Layer.

Meanwhile, the report of the Scientific Assessment Panel (SAP) of the Montreal Protocol, entrusted with the task of finding the extent of ozone depletion, showed that the actual harm to the ozone layer was much more than predicted by theoretical models and the control measures envisaged by the Protocol in 1987 would not be sufficient to arrest the depletion of ozone layer. More urgent action was, therefore, necessary. Therefore, at the 2nd Meeting of the Parties (MOP) to the Montreal Protocol, in London, in 1990, 54 Parties as well as 42 non-Party countries agreed on a package of measures satisfactory to

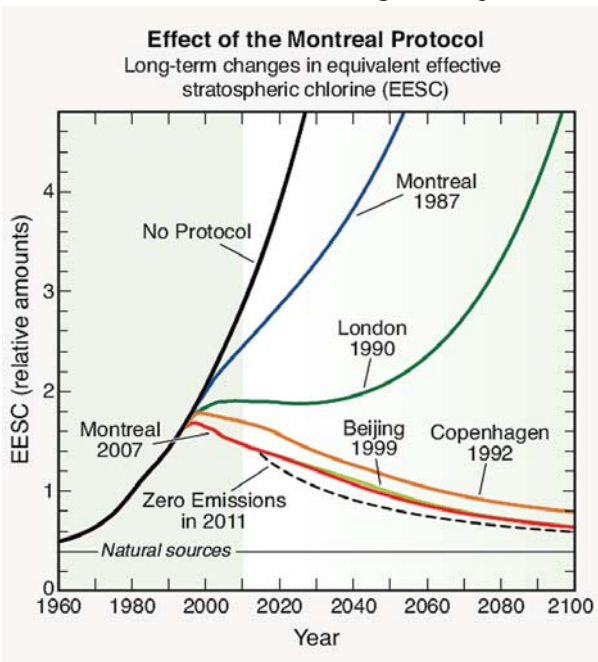

all. It was agreed in this meeting that the widely used and having high Ozone Depleting Potential (ODP) of 5 CFCs and 3 halons would be phased out by the year 2000 and other minor CFCs and CTC would be controlled and eventually phased out. A special provision was made to provide financial and technical assistance to the developing countries with an annual consumption of CFCs and halons less than 0.3 kg per capita (also called as Article 5 countries) in their efforts to phase out these harmful chemicals. These countries were also given a grace period of 10 years to phase out ODSs.

In 1991, more alarming reports came up to show that the depletion of ozone is continuing in all altitudes except over the tropics. It was recognized that the phase-out of production and consumption of CFCs and halons is not enough to control the depletion of ozone layer. Other fluorocarbon chemicals like Hydrochlorofluorocarbons (HCFCs) and methyl bromide, which are also ODSs, need to be controlled. They have also been brought under the ambit of the Montreal Protocol in 1992 through Copenhagen amendment and defining the schedule of phase-out of HCFCs in 1999 through Beijing amendment. Further, the phase-out of production and consumptions of HCFCs was accelerated in 2007 through an adjustment.

Recovery of Ozone Layer

As a result of implementation of provisions/measures under the Montreal Protocol, the atmospheric concentration of the man-made chlorine and bromine containing substances has begun to decline. Chlorine/bromine have reached to the maximum levels in the stratosphere in the first decade of the 21st century, and ozone concentrations should correspondingly be at their minimum levels during that time period. It is anticipated that the recovery of the Antarctic ozone hole has begun. But there is a slow rate of healing because of long atmospheric life of these manmade chemicals like CFCs, CTC, halons, methyl chloroform, methyl bromide etc. January 2010 marked the end of global production of CFCs and halons under the Protocol, and January 2013 the universal control of ODS production and consumption. In the early 2010s, the first signs of ozone recovery were detected. It is expected that the beginning of this recovery will not be conclusively detected for a decade or more, and that complete recovery of the Antarctic ozone layer will not occur until the year 2060 or little later. The exact date of recovery will depend on the effectiveness of present and future regulations on the emission of ODSs from banks (CFCs, halons etc.).

Status of Ratification of Vienna Convention, Montreal Protocol and Amendments

S. No.	Particulars	Date of Enforcement	No. of Parties
1	Vienna Convention 1985	22.09.1988	197
2	Montreal Protocol, 1987	01.01.1989	197
3	London Amendment, 1990	08.10.1992	197
4	Copenhagen Amendment, 1992	14.06.1994	197
5	Montreal Amendment, 1997	10.11.1999	197
6	Beijing Amendment, 1999	25.02.2002	197

Multilateral Fund

With a view to assist the developing countries in their phase out efforts, a Multilateral Fund (MLF) for the implementation of the Montreal Protocol was established in June, 1990. The Fund is supported by a Secretariat, co-located with UNEP, but directly accountable to an Executive Committee (Ex-Com) consisting of seven non-Article 5 Parties and seven Article 5 Parties. This governance structure accomplished several key objectives. First, by co-locating the MLF Secretariat with UNEP but retaining its independence in a policy context, the Parties and their appointed Ex-Com were provided with direct control over the Fund's policies. Second, the balance of non-Article 5 and Article 5 Parties on the Ex-Com signalled a major departure from the historic donor-driven nature of funding bodies that reflected the spirit of equality.

The Fund is financing incremental costs for ODS phase out in Article 5 Parties. The incremental costs, including cost of transfer of technology, incremental capital costs and incremental operating costs for switching over from ODS to non-ODS technologies enabling the developing countries to phase out controlled substances. Enterprises which were using ODS based technologies prior to cut of dates are eligible for funding for conversion from ODS to non-ODS technology from the MLF for the implementation of the Montreal Protocol.

India being an Article 5 Party is eligible for receiving technical and financial assistance from MLF to phase out ODSs and switchover to non-ODS technologies.

Alternatives to Currently Used Ozone Depleting Substances

During the last two decades intensive research has yielded a large number of substitute chemicals as replacements to CFCs, halons, CTC, methyl chloroform, methyl bromide and HCFCs. These are summarised below on end-use basis:

Technology Options for Phase-out in Refrigeration and Air-conditioning (RAC) Sector

Sub-sector	ODS used	Preferred alternatives / substitutes
Domestic refrigerators	Refrigerant: CFC-12 Foam: CFC-11 HCFC-141b	Refrigerant: HFC-134a, HC-600a, Isobutane, HC blend, HFO-1234yf Foam Blowing Agents: Cyclopentane HFC-245fa, HFC-365mfc, HFO-1234ze Methyl Formate, Methylal, Solstice- LBA, FEA-1100
Refrigerated Cabinets (Deep Freezer, Ice-cream cabinets, Bottle coolers, Visi coolers)	Refrigerant: CFC-12 Foam: CFC-11 HCFC-141b	Refrigerant: HFC-134a, HC-600a HC-blend, CO ₂ Foam Blowing Agents: Cyclopentane, HFC-245fa, HFC-365mfc, HFO-1234ze, Methyl Formate, Methylal, Solstice- LBA, FEA-1100
Water Coolers	CFC-12 HCFC-22 (for bigger capacity)	HFC-134a, HC-blend, HC-290, HFO-1234yf
Mobile (car, bus, van, refrigerated trucks, train)	CFC-12 HCFC-22 (train)	HFC-134a, HFC-1234yf HFC-152a, CO ₂ R-290, HFC-134a, HFO-1234yf, R-407C, blends of HFCs & HFOs
Central A/C plants	CFC-11, CFC-12, HCFC-123, HCFC-22	HFC-134a, R-410A, R-407C, HFO-1234yf, HC-600a, Ammonia, HC-290

Process Chillers	CFC-12, HCFC-22	HFC-134a, R-404A, R-407F, Ammonia
Ice Candy Machines	CFC-12, HCFC-22	HFC-134a, R-407F, R-290, R-404A
Walk-in Coolers	CFC-12, HCFC-22	HFC-134a R-407F R-404A
Room A/C	HCFC-22	R-410A, HC-290, HFC-32, blends of HFCs and HFOs
Packaged A/C	HCFC-22	R-410A, R407C, HFC-32, HC-290, HC-1270
Shipping	CFC-12, HCFC-22	HFC-134a, R-410A, CO ₂

Alternatives with zero ODP viz. Hydrofluorocarbon - 134a (HFC-134a) R-404A, R-407C, R-410A and R-507A have been used in various applications in many countries, especially in non-Article 5 countries. The low-Global Warming Potential (GWP) refrigerants like ammonia, Carbon-dioxide (CO₂) and hydrocarbons are also used in some applications. Attempts are being made to use Hydrocarbons like HC-290 and HC-1270 in a number of applications, including small capacity Room Air-Conditioners. Recently, low-GWP HFCs, also known as Hydrofluoroolifins (HFOs) are being applied in some applications.

Technology Options for Phase-out in Aerosol Sector

Sub-sector	ODS used	Preferred alternatives / substitutes
Perfumes, shaving foams, insecticides, paints, etc.	CFC-11/ CFC-12	Hydrocarbon Aerosol Propellant (HAP), destenched LPG, Di-methyl Ether
Metered Dose Inhalers	CFC-11 CFC-12	Hydrofluoroalkanes (HFAs)

Technology Options for Phase-out in Foam Sector

Sub-sector	ODS used	Preferred alternatives / substitutes
Flexible Polyurethane foam (PUF) Slabstock	CFC-11	Methylene Chloride
Flexible Moulded PUF	CFC-11	Water blown technology
Rigid PUF General Insulation	CFC-11 HCFC-141b	Cyclopentane, HFC-245fa, HFC-365mfc, HFO-1234ze, HFO-1233zd(E), Methyl Formate, Methylal, Solstice-LBA, FEA-1100
Thermoware	CFC-11 HCFC-141b	HFC-245fa, HFC-365mfc, Water, Methyl Formate, Solstice-LBA, FEA-1100
Integral Skin PUF	CFC-11 HCFC-141b	HFC-245fa, water, hydrocarbons Solstice-LBA, FEA-1100
Thermoplastic Foams -EPE/EPPN Foams -Phenolic Foams	CFC-11, CFC-12 CFC-11	Hydrocarbons, CO ₂
Phenolic Foams	CFC-11	Hydrocarbons

CFC-11 with ODP of 1.0 as a foam blowing agent was substituted first by a transitional technology based on HCFC-141b with 0.11 ODP. The HCFC-141b is now being replaced by zero-ODP and low-GWP foam blowing agents like cyclopentane, methyl formate and methylal. HFC based blowing agents like HFC-245fa and HFC-365mfc have also been used in non-Article 5 countries. The proposed next generation of low-GWP foam blowing agents are likely to be

HFOs-1234ze, HFO-1233zd(E), methyl formate, methylal, Solstice-LBA, FEA-1100 and Hydrocarbons.

Technology Options for Phase-out in Fire Extinguishing Sector

Sub-sector	ODS used	Preferred alternatives / substitutes
Fire Extinguishers	Halon-1211, Halon-1301, Halon-2402	Portable type ABC powder, CO ₂ Fixed type FM200, HFCs, NAF- SI/SIII

Substitutes like ABC powder and HFC based for halon-1211 used in portable fire extinguishers have also been developed and used. Some global chemical producers have developed hexafluoro propane (HFC-236fa) as an excellent substitute for halon-1211 fulfilling a long felt need. It is now being manufactured commercially.

Technology Options for Phase-out in Solvent Sector

Sub-sector	ODS used	Preferred alternatives / substitutes
Electronic and precision cleaning	CFC-113 CTC Methyl chloroform	DI Water Aqueous cleaning process Semi-aqueous cleaning process, organic non-halogenated, solvents, perfluorocarbons

Coatings	CFC-113 Methyl chloroform	Aqueous solvents Trichloro ethylene
Manufacture of pesticides and pharmaceuticals	CTC	Ethylene-dichloride Monochloro-benzene
Metal cleaning	CTC	Trichloroethylene
Chlorinated	CTC	Aqueous rubber
Textile cleaning	CTC	Aqueous system, chlorinated solvents

During the last several years, due to intensive Research and Development (R&D) efforts, new solvents have been discovered and used as alternatives to ODSs. First Hydrofluoroethers (HFEs) were considered as alternative solvents. Although, satisfactory in many respects, these were very high cost alternatives. Some patented non-ODS products have also been promoted as alternative solvents for electrical cleaning especially for tape head and disk drives (Video 40), flux removal and PCB cleaner (Deflex 160); degreasing agent (Cold kleen 110); adhesive sticker removing, computer disk cleaning (CD-150) etc. Although, these are patented products and their chemical compositions are not available but the trend is good.

2. INDIA'S COMMITMENT TO THE MONTREAL PROTOCOL

India became Party to the Vienna Convention for the Protection of the Ozone Layer on 18th March 1991 and the Montreal Protocol on Substances that Deplete the Ozone Layer on 19th June, 1992. The per capita consumption of the controlled substances in Annex A of the Montreal Protocol did not cross 20 g during 1995-97 (base line), as against 300 g per capita limit for Article 5 Parties under the Protocol. India was self-sufficient in production of chemicals like CFCs, CTC, halons and HCFCs. India was mainly producing and using nine of the 96 substances controlled under the Montreal Protocol. These are CFC-11, CFC-12, CFC-113, HCFC-22, halon-1211, halon-1301, CTC, Methyl Chloroform and Methyl Bromide.

India played a key role in the establishment of the Multilateral Fund, a financial mechanism established under the Montreal Protocol through its London Amendment in 1990. India also played a pro-active role in the implementation of Montreal Protocol in the country. India had prepared a detailed Country Program (CP) in 1993 to phase-out ODSs in accordance with its National Industrial Development Strategy. The objectives of the CP were to phase-out ODSs by accessing the Protocol's financial mechanism without undue economic burden to consumers, producers and equipment manufacturers using ODSs. The other objectives of the CP were minimization of economic dislocation as a result of conversion to non-ODS technologies, maximization of indigenous production, preference to one-time replacement, emphasis on decentralized management and minimization of obsolescence. The CP was updated in 2006 taking into account the decisions of the Montreal Protocol and national policies.

The Government of India has entrusted the work relating to ozone layer protection and implementation of the Montreal Protocol on Substances that Deplete the Ozone Layer to the Ministry of Environment, Forest and Climate Change (MoEF&CC). The MoEF&CC has set up an

Ozone Cell as a National Ozone Unit (NOU) to render necessary services for effective and timely implementation of the Protocol and its ODS phase-out program in India.

The MoEF&CC also constituted an Empowered Steering Committee (ESC), which is supported by two Standing Committees, namely the Technology and Finance Standing Committee (TFSC) and the Standing Committee on Monitoring. The ESC is Chaired by the Secretary of the MoEF&CC. The ESC oversees the implementation of the Montreal Protocol provisions, review of policies and implementation of projects/plans and monitoring.

Although, ODSs, especially CFCs and HCFCs were used in large scale in the developed countries since 1930s, India was slow to adopt these chemicals. The early use of these chemicals in India was in RAC sector and CFCs and HCFCs needed for this sector were imported in the country. The use of CFCs and HCFCs in refrigeration industry can be traced back to 1960s. Other industries using CFCs and HCFCs, such as foam manufacturing industry, aerosol industry etc., were developed only during last 35 to 40 years in the country. With the availability of CFC-11 and CFC-12 from indigenous production started in 1968, the growth of consumption of CFCs and industry increased very rapidly.

When the CP was prepared, use of ODS as solvents is estimated to account for the maximum consumption, both in MT as well as ODP tonne. RAC and Foam were the next large user sectors, followed by Aerosol sector. The consumption of ODSs in fire extinguishing sector was relatively small in terms of MT.

Status of ODS Phase-out in India

India has phased out the production and consumption of CFCs, CTC and halons as of 1st January, 2010 (except use of pharmaceutical grade CFCs in manufacturing of Metered Dose Inhalers (MDIs) for Asthma and Chronic

Obstructive Pulmonary Diseases (COPD) patients). India has also phased-out production and consumption of Methyl Chloroform and Methyl Bromide. A total of 379 projects have been approved and funded by the Ex-Com of the MLF for Implementation of the Montreal Protocol. A total amount of US 304,389,305 has been approved by the Ex-Com of the MLF to phase-out 47,693 tonne of ODSs.

Sector-wise Approved Projects as on 31.8.2018

Sector wise break-up of the funds approved by the Ex-Com of the MLF for ODS phase-out projects in India is given in the table below:

Sector	No. of Projects	Funding (US \$)	Phase out of ODP (in Tonne)
Aerosols Sector (CFC)	38	13,705,006	1,702
Foams Sector (CFC)	163	37,880,185	5,074
Firefighting Sector (Halons)	21	5,176,701	2,719
Institutional Strengthening	8	2,738,166	31
Refrigeration & Air Conditioning Sector (CFC)	87	31,827,256	3,983
Solvents Sector (including CTC production)	41	61,358,042	12,966
Production Sector (CFC and Halons)	15	84,228,000	20,107
HPMP Stage-I Preparation	1	570,000	—
HPMP Stage-I (HCFC-141b and HCFC-22)	1	21,294,490	342
HPMP Stage-II Preparation	1	490,000	—
Demonstration Project in Foam Sector Preparation (HCFC-141b)	1	30,000	—
Survey on ODS Alternatives	1	180,000	—
HPMP Stage-II (HCFC-141b and HCFC-22)	1	44,911,459	769
Total	379	304,389,305	47,693

SECTOR PHASE-OUT PLANS

CFC Production Sector Phase-out Project in India

The Ex-Com of the MLF in its 29th meeting held in November 1999 approved the India's CFC Production Sector gradual phase-out project with a total grant amount of US \$82 million to phase-out production of 22,588 ODP tonne of CFCs. The amount US \$80 million was to be provided as a performance based grant to CFC producers for meeting the CFC production phase-out targets. The remaining US \$2 million was for Technical Assistance (TA) component to establish Project Management Unit (PMU) under the Ozone Cell to develop and implement monitoring, auditing and reporting mechanisms, in addition to conduct awareness and training programs. The World Bank was the lead implementing agency for the project. UNEP has been designated as the implementing agency for TA component. In this project, it was agreed to reduce total CFC production in accordance with the following agreed schedule:

Agreed Schedule for Phase-out of CFC Production

Year	CFC Production Quota (MT)	Phase-out Quantity (MT)
1999	22,588	-
2000	20,706	1,882
2001	18,824	1,882
2002	16,941	1,883
2003	15,058	1,883
2004	13,176	1,882
2005	11,294	1,882
2006	7,342	3,952
2007	3,389	3,953
2008	2,259	1,130
2009	1,130	1,129
2010	0	1,130

Accelerated Phase-out of CFCs

India agreed at the 54th Ex-Com of the MLF

meeting held from 7th to 11th April, 2008 in Montreal, Canada to accelerate the phase-out of production of CFCs by 1st August, 2008 with an additional grant of US \$3.17 million to the CFC producers. As per the decision, India agreed that it will produce not more than 690 MT of CFCs until 1st August, 2008 primarily for the manufacturing of MDIs. India's CFC producers would sell no more than 825 MT of CFCs for MDI production in the years 2008 and 2009, comprising 690 MT of new production and 135 MT reprocessed from existing stock. In addition, India would not import any more CFCs.

India has completely phased-out the production and consumption of CFCs with effect from 1st August, 2008, 17 months ahead of the agreed phase-out schedule except the use of pharmaceutical grade CFCs in manufacturing of MDIs. The Ex-Com of the MLF has released the total grant of US \$3.17 million, the grant approved for accelerated phase-out of CFCs.

The National Strategy for Transition to Non-CFC MDIs and Plan for Phase-out of CFCs in the Manufacture of Pharmaceutical MDIs has been implemented successfully by United Nations Development Program (UNDP) as lead implementing agency, UNEP and Government of Italy as cooperating agencies in close cooperation with the MDI manufacturing industry under the guidance of Ozone Cell, MoEF&CC.

Halon Production and Consumption Phase-out in India

The phase-out of consumption of halons in India was initiated as early as 1994. The 13th Ex-Com of the MLF approved a demonstration project for evaluation of alternative technologies for halon, fire protection system and technical assistance for sectoral strategy with a funding of US \$ 309,000. It followed with the approval of 14 individual investment projects by the Ex-Com of the MLF from 1995 to 1999 which resulted in phase-out of 1768 ODP tonne of halons. These projects were successfully completed in 2001.

Subsequently, the Ex-Com of the MLF in its 34th meeting held in 2001 at Montreal approved US \$2.6 million for complete phase out of the production and remaining consumption of halons in the country. This project was successfully implemented and achieved the objective of complete phase-out of production and consumption of halons in India, as early as 2003.

The enterprises, producing halons have dismantled their production plants. At present, there is no halon production in India. The phase-out activities of production and consumption of halons in all the enterprises have been successfully completed.

Fire Extinguishing Industry Structure: There were two halon production facilities in India at M/s Navin Fluorine International Ltd. (NFIL) and M/s SRF Ltd. M/s SRF was producing halon-1211 and halon-1301, while M/s NFIL was producing only halon-1211. The total production capacity of halon in the country was 800 MT.

There were about 200 manufacturers of fire extinguishing equipments, of which over 85% were manufacturers of portable fire extinguishers in the country. Halons, which are potent ODSs, were used only in about 5% of the fire extinguishing applications.

Halon Consumption: In 1991, the total consumption of halons in India was 750 MT, equivalent to 3,650 ODP tonne. This constituted 7.2% of India's total ODS consumption and almost 28% of the total consumption in ODP tonne. Imports accounted for 550 MT of the total, while 200 MT was indigenously produced. The growth rate in this sector was forecasted at 15% annually.

Technology: As noted earlier, the use of halons in fire-fighting equipments constituted only about 5% of the fire-fighting applications in India. There were no drop-in replacement technologies identified. However, a wide variety of fire extinguishing technologies were identified at the time of preparation of the CP, viz., ABC powder, CO₂-based systems, foam based systems, inert gases, HFC-based systems,

fast response sprinklers, etc. Among the priority actions identified to address the ODS phase-out in this sector were:

- Revision of national fire-extinguisher codes and standards to promote halon alternatives;
- Halon conservation program to limit emissions;
- Establishment of a halon management program, including halon banking.

Establishment of Halon Banking Facility: The production of halons has been phased-out globally at the early stage of the Protocol because of high ODP values of halons. Moreover, there is a large quantity of halons banked in fire extinguishing equipments. The MoEF&CC has established National Halon Banking Facility at Centre for Fire, Explosive and Environment Safety (CFEES), Defence Research and Development Organization (DRDO), Ministry of Defence, New Delhi with the financial assistance from the MLF of the Montreal Protocol. This facility has the capability to recover, recycle and store the halons for future use in the existing equipment. It is worth mentioning that all the three Defence forces have also established their own Halon Banking Facilities to meet the future requirements.

CFC Phase-out in Foam Manufacturing Sector

The Foam Manufacturing sector was one of the major ODS consuming sectors in India predominantly using CFC-11 as blowing agent. As of June 2002, 158 projects and activities were approved by the Ex-Com of the MLF to phase-out 4401 ODP tonne of CFCs with a funding of US \$29.36 million. These projects/activities were successfully implemented and achieved the phase-out of CFCs in this sector.

The Ex-Com of the MLF, at its 37th meeting held in July 2002 approved the foam sector phase-out plan with a total funding of US \$5.42 million to phase-out the remaining 612 ODP tonne of CFC-11 in foam manufacturing

sector. UNDP was responsible for implementation of this plan. A total of 122 foam manufacturing enterprises under this sector plan have phased-out 702 MT of CFCs from their processes. The foam sector CFC phase-out plan has been successfully implemented and use of CFCs has been completely eliminated in foam manufacturing sector in the country.

Industry Structure: The survey of the Foam Manufacturing sector carried out at the time of preparation of CP in 1993 identified about 235 foam manufacturers in India using CFCs as blowing agents. About 20% of the enterprises were large/medium size, while the rest were Micro, Small and Medium Enterprises (MSMEs) in the unorganized and informal sector.

The sub-sectors identified were rigid polyurethane foam, flexible polyurethane foam, integral skin polyurethane foams, thermoplastics foams (extruded polyethylene and polystyrene foams) and phenolic foams. An important sub-sector in the Foam sector, namely, the flexible slab-stock foam mostly converted from CFCs to methylene chloride as the blowing agent during 1980s due to economic reasons. The domestic refrigerator manufacturers were large and main users of CFCs in the rigid polyurethane foam sub-sector. Another important sub-sector within the Foam Manufacturing sector, the rigid polyurethane foam used in the production of insulated thermo-ware (flasks, casseroles, water-bottles, lunch-boxes, etc), was considered important due to the large number of MSMEs involved.

There were four major producers of polyol systems, who formed the main upstream source of raw materials for the polyurethane foam manufacturers and were meeting about half of the total demand. The remaining half of the demand was met through imports.

ODS Consumption in Foam Sector: In 1991, the consumption of CFCs in foam manufacturing

sector was 1,580 MT, predominantly CFC-11, which amounted to about 31% of India's total CFC consumption in the country. It was estimated that the demand for foam products would grow at 15-20% annually until 2010. The Foam sector was therefore identified as a priority sector in India for initiating phase-out activities.

Technology: The following technological options have been identified for phasing out ODSs in the foam manufacturing sector. Some of the technologies, especially the low GWP technologies are still emerging.

Technological Options in Foam Sector

Sub-sector	Interim Technology	Long Term Technology
PU RIGID FOAM		
Domestic refrigerators - freezers	HCFC-141b	hydrocarbons, HFC-245fa, HFC-134a, HFOs Solstice-LBA, FEA-1100
Other appliances	HCFC-141b	hydrocarbons, HFC- 245fa, HFC-365mfc/ HFC-227ea blends, HFC-134a, methyl formate, CO ₂ (water), HFOs
Transport & reefers	HCFC-141b	hydrocarbons, HFOs HFC-245fa, HFC-365mfc/ HFC-227ea blends, HFC-134a
Continuous Panels	HCFC-141b	hydrocarbons, HFC-245fa, HFC-365mfc/ HFC-227ea blends
Discontinuous panels	HCFC-141b	HFC- 245fa, HFC-365mfc/ HFC-227ea blends, HFC-134a, hydrocarbons, CO ₂ (water), formic acid, methyl formate

Spray	HCFC-141b	HFC-245fa, HFC-365mfc/ HFC-227ea, Supercritical CO ₂ , CO ₂ (water), HFOs
Pipe-in-pipe	HCFC-141b	hydrocarbons, HFC- 245fa, HFC-365mfc/ HFC-227ea blends, CO ₂ (water), methyl formate
EXTRUDED POLYSTYRENE		
XPS Sheet	HCFC-142b, HCFC-22	Hydrocarbons (butane, isobutane, pentane, isopentane), HFCs (HFC-134a, HFC-152a) & hydrocarbon / CO ₂ (LCD) blends
XPS Board	HCFC-142b, HCFC-22	HFCs + blends, CO ₂ (or CO ₂ /alcohol), hydrocarbons
PU FLEXIBLE FOAM		
Integral Skin	HCFC-141b, blends of HCFC-142b and HCFC-22	CO ₂ (water), HFC-134a, HFC- 245fa, HFC-365mfc/ HFC-227ea blends, n-pentane, methyl formate
Shoe Soles	HCFC-141b, HCFC-142b	CO ₂ (water), HFC-134a
Flex moulded	HCFC-141b, HCFC-142b	CO ₂ (water), methyl formate
Flexible Slab Stock	HCFC-141b, HCFC-142b	CO ₂ (water), methylene chloride

It was considered strategically important to support the conversion of manufacturing facilities of the polyol systems house(s) on a priority basis, to enable them to customize non-CFC formulations, thus facilitating CFC phase-out in the downstream foam manufacturers more economically. It was also recognized that there were large number of MSMEs operating in this sector, which could not be identified at the time of preparation of

the CP. However, these were addressed subsequently.

The HCFCs like HCFC-141b, HCFC-142b and HCFC-22 are commonly used as interim substitutes to phase-out CFCs in foam manufacturing sector. The accelerated phase-out of HCFCs, as agreed at the 19th MOP held in September, 2007, would require conversion of foam manufacturing facilities from HCFCs to non-ODS technologies viz. hydrocarbons, HFCs, low-GWP HFCs, HFOs, Methyl Formate, Methylal etc. Phase-out of HCFC-141 b as a foam blowing agent has been inter alia proposed to be taken up under the HCFC Phase out Management Plan (HPMP) Stage II.

CFC Phase-out in RAC Sector

The phase-out of CFCs in RAC sector in India was initiated as early as 1993. As of July, 2002, a total of 47 investment and technical assistance projects were approved with a total funding of US \$22.3 million leading to a total phase-out of 1821 ODP tonne of CFCs. Subsequently, the Ex-Com of the MLF in its 38th meeting held in November 2002 approved a multi-year performance based sector phase-out plan covering the refrigeration (manufacturing) sector with a total funding of US \$3.6 million to phase-out the remaining CFC consumption of about 535 ODP tonne. UNDP was responsible for implementation of the commercial refrigeration component and United Nations Industrial Development Organization (UNIDO) was responsible for implementation of the transport refrigeration sub-sector under this sector-plan. A total of 157 enterprises for commercial refrigeration (manufacturing) sector and 39 enterprises in transport refrigeration (manufacturing) sector were identified during the implementation of the plan. The sector phase-out plan has been successfully implemented and phased out the use of CFCs completely in refrigeration (manufacturing) sector in the country.

RAC Industry Structure: The RAC sector in India has a long history from the early years

of last century. Major investments in establishing manufacturing capacities started in 1950s. On the upstream side, there were only two compressor manufacturers exclusively for hermetic compressors. In addition, there were some appliance manufacturers, which also had the dedicated facilities for manufacturing of hermetic compressors. However, there were several manufacturers of open-type compressors. Many other components of refrigeration systems were also manufactured in the country.

ODS Consumption in RAC Sector: In 1991, the total ODS consumption in the RAC sector in India was 1,990 MT. This constituted about 39% of India's total consumption of CFCs. About two-third of this consumption was estimated to be used in servicing of existing equipment. The growth rate in this sector was forecasted at 10-20% annually until 2010. The RAC sector was, therefore, identified as another priority sector in India for initiating phase-out activities.

National CFC Consumption Phase-out Plan (NCCoPP)

The Ex-Com of the MLF at its 42nd meeting held in April, 2004 approved the NCCoPP for the RAC servicing sector at a total funding level of US \$6.388 million to phase-out 1502 ODP tonne of CFCs. The Government of Germany (bilateral implementing agency) was responsible for implementation of this project as the lead Implementing Agency along with UNDP, UNEP, UNIDO and Government of Switzerland as cooperating implementing agencies. The Government of Switzerland was responsible for training activities and UNDP was responsible for equipment support. UNEP was responsible for creation of awareness activities. Besides, UNEP was organizing customs and policy training activities in collaboration with National Academy for Customs, Excise and Narcotics (NACEN). UNIDO jointly with UNDP was responsible for implementation of CFC phase-out activities in transport refrigeration.

The project's main focus was on training of refrigeration servicing technicians who were involved in servicing of RAC equipments based on CFCs and non-ODS alternatives. It also covered training for Mobile Air-Conditioning (MAC), RAC equipments using Open Type Compressor (OTC) and specifically targeted the Railways as a key institutional user of CFC refrigerants. The project adopted a multi-pronged approach to achieve its targets. In addition to training, equipment support, awareness creation among the stakeholders and capacity building of customs officers on illegal ODS trade were included.

Information dissemination and creating awareness regarding CFC phase-out in India is of utmost importance to ensure the project's success. Various methods were employed to create awareness viz. video film, posters, newsletter, flyers, dealer workshops, equipment support workshops, articles in newspapers and dedicated website.

NCCoPP was funded by the MLF for implementation of the Montreal Protocol. NCCoPP took over from the Indo-Swiss-German Project "Ecological Refrigeration (ECOFRIG)" and Indo-Swiss Project "Human and Institutional Development in Ecological Refrigeration (HIDECOR)". ECOFRIG began within the framework of Indo-Swiss-German Cooperation in 1992 with an objective to evaluate the hydrocarbon technology in RAC appliances for replacing CFCs. ECOFRIG project and the HIDECOR established a training setup including well-developed excellent training modules and a pool of trained trainers throughout the country. The HIDECOR activities, initiated in 1998, were geographically restricted to selected states and the target group was limited to Micro, Small and Medium size Servicing Enterprises in the RAC sector. NCCoPP established training infrastructure including training cells in 15 states of India. It aimed to encourage good servicing practices among all RAC servicing enterprises, with a special focus

on those firms which were consuming more than 50 kg of CFCs per annum. A total of 955 recovery, recycling units were provided to the enterprises in four stages. Equipment support to 120 Industrial Training Institutes (ITI) was also provided.

Awareness generation workshops were conducted for servicing enterprises, so that most of the enterprises across the country could participate in the project and get the advantage of assistance provided under the Montreal Protocol to phase-out CFCs in servicing sector.

As stated earlier, the focus of activities of NCCoPP was training of RAC servicing technicians. During training, the participants/technicians were taught how to handle the alternative refrigerants, good servicing practices and emphasis was laid on recovery, recycle, reclamation and reuse of CFCs. Therefore, the training programs have helped in creating a demand for recovered and reclaimed refrigerants. Over 20,000 technicians were trained under NCCoPP and its forerunner projects, ECOFRIG and HIDECOR. The requirement of CFCs was substantially decreased because of training on good service practices. The remaining requirement for servicing was addressed through reclamation and reuse of CFCs. A number of reclamation centres have been established at various locations in the country, viz. Bangalore, Chandigarh, Hyderabad, Ahmedabad, Jaipur, Kolkata, and Lucknow. The reclamation units have also been provided to Indian Railways and Defence forces.

The NCCoPP has been successfully implemented as per the schedule and achieved its objective of complete phase-out of CFCs.

Strategy for Solvent Sector to Phase-out ODS in MSMEs in India

The Ex-Com of the MLF in its 35th meeting held in December, 2001 approved a project to prepare "Overall Strategy for the Solvent Sector to

support the phase out of ODS in MSMEs in India" at a total cost of US \$169,500 implemented by UNEP in consultation with the World Bank and UNIDO. This project was to assist India in developing an overall strategy for the solvent sector which would cover both non-investment and investment activities to support the phase-out of ODS in the solvent sector in India and assist India in meeting its 2005, 2007 and 2010 commitments for the solvent sector. The aim of the project, at the operational level, was to develop approaches for assisting MSMEs which use solvents in India through training, Solvent Alternative Technology Service (SATS), information dissemination and investment and non-investment activities.

The project was completed successfully by UNEP and submitted the report to the Ozone Cell and the World Bank. The outcomes of the strategy document were incorporated in the preparation of the National CTC Phase-out Plan prepared by the World Bank.

National CTC Phase out Plan

The Ex-Com of the MLF at its 40th meeting held in July, 2003 approved the National CTC Phase out Plan at a total funding level of US \$52 million to phase-out 11553 ODP tonne of CTC production and 11505 ODP tonne of CTC consumption. This included US \$10 million under the bilateral assistance program with the Governments of Germany, France and Japan contributing US \$2 million, US \$3 million and US \$5 million respectively.

Out of the total amount, US \$28.5 million was allocated for CTC production phase-out, US \$21.5 million for CTC consumption phase-out and US \$2 million were allocated for TA component. The World Bank is the lead implementing agency, the Governments of Germany, France and Japan (bilateral agencies) and UNIDO were cooperating agencies for implementation of the National CTC consumption phase-out activities. Besides, UNDP, on behalf of Government of Japan, is

responsible for executing conversion activities from CTC to non-ODS technologies in large and medium enterprises in metal cleaning sub-sectors.

Production Sector: The CTC producing enterprises, M/s. SRF Ltd., New Delhi, M/s. Chemplast Sanmar Ltd., Chennai, M/s. Gujarat Alkalies and Chemicals Ltd., Vadodara signed the performance agreement and submitted an Indemnity bond for meeting the production phase-out targets. M/s. Shriram Rayons Ltd., Rajasthan and M/s. NRC Ltd., Mumbai have already closed down their production facilities. The production of CTC in the country has successfully been phased out as of 1st January, 2010 except co-production of CTC during the production of chloromethane and the co-produced CTC is being used only for feedstock applications.

Consumption Sector: CTC was used as feedstock primarily in the production of CFCs and DV Acid chloride. CTC was also used in India as a process agent and a solvent. For process agents, CTC was used in sectors such as chlorinated rubber, chlorinated paraffin, pharmaceutical, and agro-industries. CTC was used as a solvent in the textile, garment industries, metal cleaning etc.

In 2006, a total of 103 CTC projects, covering both process agent and solvent applications were identified and the phase-out of CTC in these applications was taken up by the implementing agencies. The CTC consumption phase-out projects have been successfully implemented and resulted in phase out of 2,080 ODP tonne of CTC. The consumption of CTC had been phased out completely in the country since 1st January 2010 as per the Montreal Protocol schedule.

Technical Assistance was provided to replace CTC used in stain removal work for small garment manufacturers and metal cleaning. The fast reduction in the supply of CTC had increased the CTC price significantly in the country and

that motivated the MSMEs to move away from CTC. GIZ carried out extensive work in testing of alternatives that meet health, safety and environmental standards. A countrywide survey was carried out to identify MSMEs using CTC in the metal cleaning sub-sector. The survey identified 44 eligible MSMEs which were using CTC in metal cleaning. These enterprises were provided funding towards incremental capital and operating costs for phasing out of CTC in metal cleaning sector.

The achievement of CTC phase-out in two widely dispersed industry sectors, namely, the garment manufacturing and metal cleaning has also been realized through awareness programmes and policy measures, especially those which influenced the availability and pricing of CTC and its alternatives.

The production and consumption of CTC have been completely phased-out as of 1st January, 2010.

Since 2011, the Ozone Cell, MoEF&CC has been carrying out technical assistance activities, including awareness for sustaining the phase-out of CTC in different applications, except in feedstock use.

As part of the remaining activities under the Technical Assistance component of the project the following activities have been conducted:

- a) 12 stakeholder consultative workshops were organized across the country with the objective to create awareness to all the concerned stakeholders on all issues relating to ODS, including sustainability of ODS phase out, particularly CTC, issues related to reporting mechanisms, including for CTC, which continues to be produced, primarily from DV acid chloride production, to be used for feed stock applications.
- b) A study on CTC usage in India for feedstock applications was carried out to assess the co-production of CTC during production of Chloromethane and document the use of

CTC in various feed stock applications. The report of the study is under finalization.

- c) A publication of National CTC Phase out: India's Success Story was developed highlighting India's achievements in the phase out of production and consumption of CTC as per the Montreal Protocol schedule. The proactive steps taken as well as measures taken to address the challenges during implementation are also highlighted. The publication is under finalization.

CFC phase-out in Aerosol Sector

Aerosols are widely used in several applications involving propellants, including perfumes, shaving foams, insecticides, pharmaceuticals, paints and inhalers. CFC-11 and CFC-12 were commonly used as propellants in this sector. By the end of 2002, a total of 26 investments and technical assistance projects were completed with a total funding of US \$6.5 million, leading to a total phase-out of 637 ODP tonne of CFCs in Industrial Aerosol Sector. The Ex-Com of the MLF in its 38th meeting held in November, 2002 approved a terminal umbrella project in this sector with a funding of US \$0.58 million to phase-out remaining CFC consumption of about 52 ODP tonne in this sector. The consumption of CFCs in aerosol sector had been completely phased-out as early as December, 2003.

Industry Structure: The total production of aerosol containers in 1991 was estimated to be 45 million, of which over 90% used CFCs as propellants. About 200 aerosol manufacturers were identified, concentrating mainly in the western and northern parts of India. All enterprises were in the private-sector. A significant majority of these enterprises (about 70%) were MSMEs, many of which were in the informal sector, principally, manufacturing personal care products such as perfume and deodorant sprays.

ODS Consumption in Aerosol Sector: In 1991, the Aerosol sector consumed 1,100 MT of CFCs (about 40% CFC-11 and 60% CFC-12), which amounted to about 22% of India's total CFC consumption at that time. It was estimated that the demand for aerosol products would grow at 20% annually until 2000, 18% annually until 2005 and 15% annually until 2010. These estimates were based on considerations such as emerging customer base for personal care products, entry of multinational corporations in India leading to expansion of the manufacturing base in this sector, reduction in taxes on cosmetic aerosols, etc.

Technology: Hydrocarbon based aerosol propellants were identified in most of the aerosol sub-sectors as the preferred substitute technology for phasing out CFCs, specifically, butane, destenched Liquefied Petroleum Gas (LPG), etc.

The MSMEs predominantly used locally developed manual propellant filling machines, which were suitable for CFC propellants, but considered unsafe and unsuitable for hydrocarbon-based substitute propellants. Moreover, many of the MSMEs had manufacturing facilities in locations which could be considered unsafe for handling hydrocarbon-based propellants. Thus, safety measures for handling hydrocarbons including safety training and audits were identified as important inputs, in addition to investments needed for conversions.

The consumption of CFCs in Aerosol Sector has already been completely phased out as early as December, 2003 except use of pharmaceutical grade CFCs in manufacturing of medical aerosols, MDIs for Asthma and COPD patients.

National Strategy for Transition to non-CFC MDIs and Plan for Phase-out of CFCs in Manufacturing of Pharmaceutical MDIs

The National Strategy for Transition to Non-CFC MDIs and Plan for Phase-out of CFCs in manufacturing of Pharmaceutical MDIs was

approved by the Ex-Com of the MLF in its 56th meeting held in November, 2008 with a total funding of US \$10.2 million to phase-out 704.03 ODP tonne of CFCs. This project articulated India's national strategy for transition to non-CFC MDIs gradually without affecting the Asthma and COPD patients and the elimination of CFC consumption in manufacturing of MDIs in India.

The National Strategy for phase-out of CFCs in MDIs had been implemented successfully by UNDP as lead implementing agency in association with Government of Italy (bilateral agency) and UNEP, in close cooperation with the MDI manufacturers under the guidance of Ozone Cell, MoEF&CC.

National Awareness Workshops were organized for the stakeholders, especially the MDI manufacturers and physicians treating the asthma and COPD patients. A workshop on "Phase-out of CFCs in MDIs Transition Strategy Implementation and Adoption of CFC free Alternatives in India" was held on 5th October, 2009 at the All India Institute of Medical Sciences (AIIMS), New Delhi in collaboration with Ministry of Health and Family Welfare (MoHFW) and UNEP. Another National Consultative Workshop on Policy and Regulations was organized on 20th May, 2010 at Central Drugs Standard Control Organization, MoHFW, New Delhi. A regional awareness workshop on phase-out of CFCs in manufacturing of MDIs was organised on 1st October, 2010 at Pune. These workshops were well attended by the stakeholders including medical representatives. The medical representatives are the key stakeholders to create awareness among the physicians across the country. During the workshops the MDI manufacturers shared that a number of CFC free MDIs have been developed and placed in the market.

The pharmaceutical grade CFCs were needed during transition phase in 2010 and beyond by the MDI manufacturing industry. The same were obtained through the Essential Use

Nomination (EUN) process of the Montreal Protocol for 2010. India submitted the EUN for 2010 for 350.6 MT of pharmaceutical grade CFCs and the 21st MOP held in November, 2009 approved 343.6 MT of CFCs for India for 2010. India had also submitted the EUN for the year 2011 for 192.3 MT, but the same was withdrawn in consultation with MDI manufacturers as the progress made by MDI manufacturers was commendable and the MDI manufacturers decided not to seek any CFCs for manufacturing of MDIs for 2011 and beyond. The MDI manufacturers have converted all the CFC based MDI formulations to CFC-free and placed in the market. Currently, all the formulations of MDIs available in the market are CFC-free since 2011.

The 22nd MOP held in November, 2010 congratulated India for its outstanding achievement in early phase-out of the use of pharmaceutical grade CFCs in manufacturing of MDIs.

UNDP, as lead implementing agency, carried out an independent verification through a MDI International Expert in November, 2012 for all the 4 MDI manufacturing facilities to verify the phase-out of use of CFCs in manufacturing of MDIs. The verification confirmed that conversion from CFC based MDIs to CFC-free MDIs has already been achieved in India.

A verification-cum-review of progress made by each of the manufacturers was undertaken by the MLF through an independent expert along with UNDP to ascertain the implementation of CFC phase-out in the manufacturing of MDIs in February, 2014. It was reported that CFCs have been phased-out in manufacturing of MDIs in the country.

UNEP under the guidance of Ozone Cell, MoEF&CC organized two awareness workshops, one at Sri Ramaswamy Memorial (SRM) University, Chennai on 19th August, 2014 and another at Sanjay Gandhi Postgraduate Institute of Medical Sciences (SGPGI), Lucknow on 25th August, 2014 with the objective to create

awareness for sustaining the phase-out of pharmaceutical grade CFCs in a critical medical use. Both these workshops were well attended by the physicians and pharmaceutical representatives who are the key stakeholders for promoting CFC-free MDIs among the asthma and COPD patients.

Recognizing the efforts and the pro-active role played by the MDI manufacturers in the phase out of CFCs in the manufacturing of MDIs, all the 4 MDI manufacturers were presented a plaque during the awareness workshop on 19th August 2014.

Accelerated Phase-out of HCFCs

The control schedule of the Montreal Protocol for Article 5 Parties for phase-out of HCFCs prior to the 19th MOP was as follows:

Consumption

- Base level: 2015
- Freeze: January 1, 2016
- 100% reduction: January 1, 2040

Production

- Base level: Average of production and consumption in 2015
- Freeze: January 1, 2016, at the base level for production
- 100% reduction: January 1, 2040.

The 19th MOP held in September, 2007 took a decision to accelerate the phase-out of production and consumption of HCFCs for developed and developing countries. The new phase-out schedule for Article 5 Parties as per the decision of the 19th MOP is as follows:

- Base level: average of 2009 and 2010.
- Freeze: January 1, 2013
- 10% reduction: January 1, 2015
- 35% reduction: January 1, 2020
- 67.5% reduction: January 1, 2025

- 100% reduction: January 1, 2030 with a service tail of 2.5% annual average during the period 2030-2040.

The accelerated phase-out schedule of HCFCs for Article 5 parties is also depicted below:-

Allowing for servicing an annual average of 2.5% during the period 2030-2040

The implementation of the accelerated phase out schedule for HCFCs was a challenging task, especially the Stage-I targets, the 2013 freeze and 10% reduction in 2015, in emerging economies like India where there was growth in the use of these chemicals. These chemicals are widely used in various applications including RAC manufacturing, foam manufacturing, RAC servicing and other sectors. There was a lack of availability of technically proven, economically viable and environment friendly technologies. The annual consumption growth of these chemicals has been in the range of 10% to 15%. In actual sense, this amounted to phase-out of 30% to 40% by 2015, which was quite significant reduction in a very short time frame. This necessitated a long term vision and planning to successfully meet the obligations of the accelerated phase- out schedule of HCFCs.

Based on the decision of the 19th MOP, the Ex- Com of the MLF in its 54th meeting held in April 2008 vide its decision 54/39 approved the guidelines for preparation of HPMP Stage-I in Article 5 Parties. The 60th Ex-Com held in April 2010 finalized the guidelines for phase-out of HCFCs, except for the production

sector which is still under consideration by the Ex-Com of the MLF.

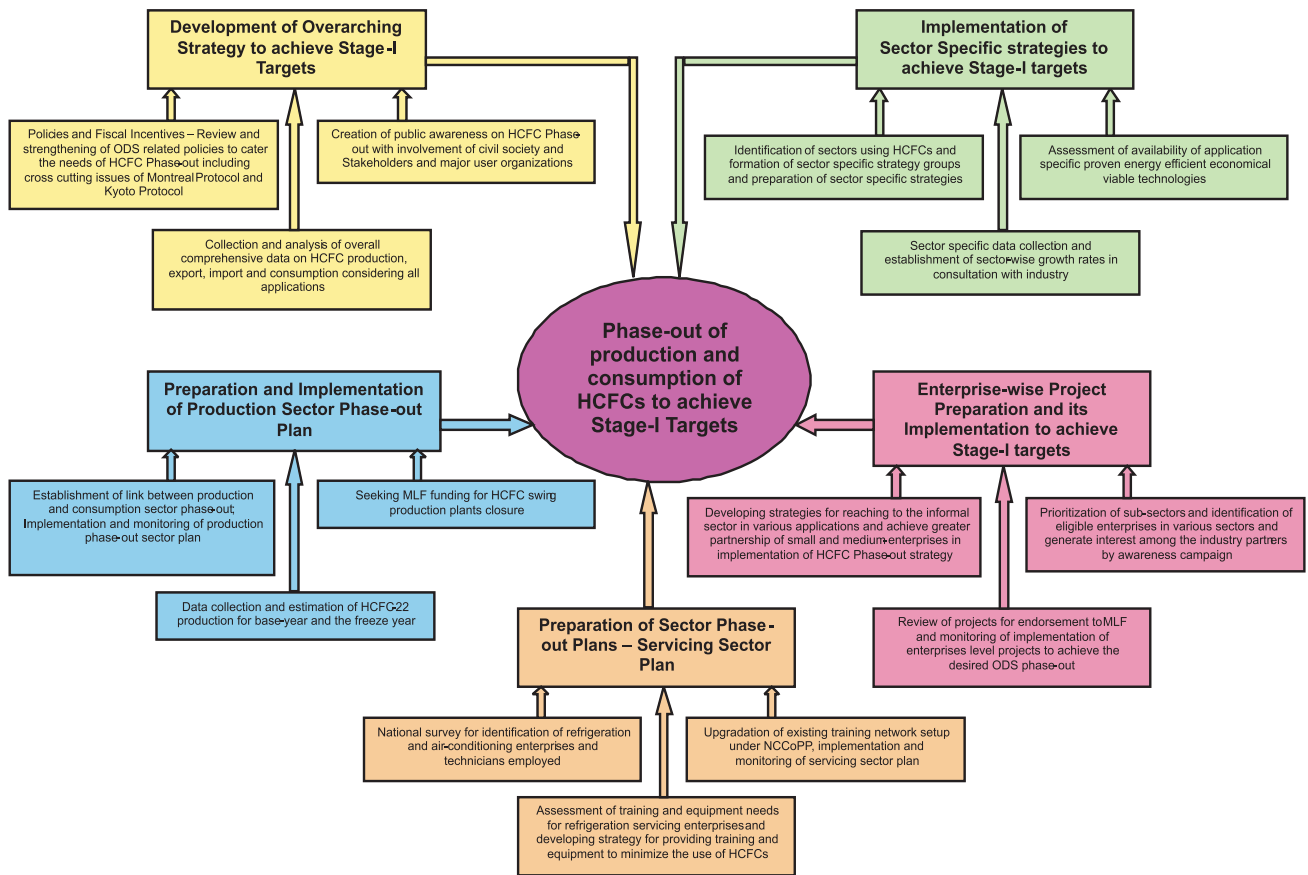

India's HPMP

The implementation of the accelerated phase out schedule for HCFCs was a challenging task, especially the Stage-I targets, the 2013 freeze and 10% reduction in 2015, in emerging economies like India where there was growth in the use of these chemicals. These chemicals are widely used in various applications including RAC manufacturing, foam manufacturing, RAC servicing and other sectors. There was a lack of availability of technically proven, economically viable and environment friendly technologies. The annual consumption growth of these chemicals has been in the range of 10% to 15%. In actual sense, this amounted to phase-out of 30% to 40% by 2015, which was quite significant reduction in a very short time frame. This necessitated a long-term vision and planning to successfully meet the obligations of the accelerated phase-out schedule of HCFCs.

Considering the future activities relating to phase-out of HCFC production and consumption in India to meet the compliance target as per the accelerated phase-out schedule, the UNDP was designated as the Lead Implementing Agency for HCFC phase-out in consumption sector and the UN Environment (formerly UNEP), UNIDO, The World Bank and bilateral agencies comprising of Government of Germany and France etc., as cooperating implementing agencies.

HPMP Stage-I

The 56th meeting of the Ex-Com of the MLF held in November 2008 approved the preparation of HPMP Stage-I for India. Soon thereafter, detailed stakeholder consultative meetings including sectoral working group meetings for the foam manufacturing, RAC manufacturing and RAC servicing sectors were held. Based on the outcome of these meetings, a "**Roadmap for phase-out of HCFCs in India**" describing the long-term vision and action plan including the policy instruments for phasing

ROADMAP FOR PHASE-OUT OF HCFCs IN INDIA AT A GLANCE

out of production and consumption of HCFCs in India was developed and launched in October 2009.

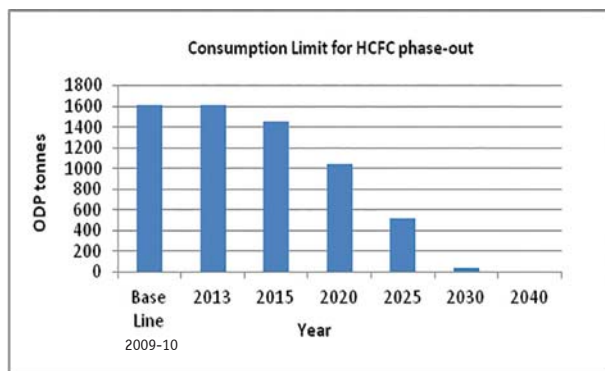

The Indian Polyurethane Association (IPUA) which represents key manufacturers and suppliers in polyurethane industry for furthering the interest of the polyurethane industry in India and the Refrigeration and Air-conditioning Manufacturing Association (RAMA), which represents key manufacturers and suppliers in RAC industry for furthering the interest of the RAC industry in India, were entrusted with the responsibility of preparation of sectoral strategies in the foam and RAC manufacturing sectors, in close cooperation with the UNDP and Ozone Cell, MoEF&CC. Both IPUA and RAMA conducted surveys involving market research consulting agencies and collected data, based on questionnaire developed for the purpose.

The sectoral strategies for phase out of HCFCs in foam and RAC manufacturing sectors were developed after analysis of the data and taking into account the phase-out targets to be achieved for HCFCs as per the accelerated phase out schedule of the Montreal Protocol, the policy guidelines of the Ex-Com of the MLF and the present and likely future industry structure in the respective sectors. India prioritized phase-out of HCFC141b (having high Ozone Depleting Potential (ODP) in foam manufacturing sector in the large HCFC consuming enterprises. The RAC Servicing strategy was prepared by GIZ, Govt. of Germany as implementing agency. All the sectoral strategies were developed in close cooperation with the Ozone Cell, MoEF&CC and the Implementing agencies.

The consumption phase out limits for India are as follows:

HCFC Phase-out Limits for India

Montreal Protocol Maximum Allowable Consumption of Levels of Annex C Group 1 Substances	Consumption Limit (ODP tons)
Baseline (2009-2010 average)	1608.20
2013- Freeze on baseline levels	1608.20
2015- 90% of the baseline	1447.38
2020- 65% of the baseline	1045.33
2025- 32.5% of the baseline	522.67
2030- 2.5% of the baseline	40.21
2040- No consumption	0

A two-day stakeholder workshop was organized in October, 2011 for finalization of sectoral strategies and overarching HPMP Stage-I. Based on the inputs received during the workshop and keeping in view the phase out targets to be achieved as per the accelerated phase out schedule for HCFCs, the domestic and international requirements for accelerated phase-out and the Ex-Com prioritization policy of substances to be phased-out based on Ozone Depleting Potential (ODP), availability of alternative technologies and the capability of the industry to adapt to these alternative technologies, India prioritized phase out of HCFC 141b in the foam manufacturing sector in large manufacturing enterprises, who could effectively handle cyclopentane as a blowing agent, the available low GWP alternative having negligible ODP.

The HPMP Stage-I was finalized to address phase out of HCFC 141 b in 15 large enterprises in the domestic refrigeration, continuous sandwich panel and discontinuous sandwich panel subsectors. Also, technical and financial assistance was secured for 15 systems houses for developing HCFC free polyol formulations, which would assist the Micro Small and Medium Enterprises (MSMEs) to cost-effectively phase-out HCFCs as this was critical for phase-out of HCFCs in the foam sector during HPMP Stage-II. In addition, in the RAC servicing sector activities comprising technicians training, institutional strengthening for effective use of HCFC based equipment and awareness and enforcement training as part of the enabling component, were also included.

The HPMP Stage-I was approved by the Ex-Com of the MLF in its 66th Meeting held in April, 2012 to reduce 341.77 ODP tonne of HCFC from the starting point of 1691.25 ODP tonne with a total funding of US \$ 23,011,537 including implementing agency support costs.

Since the approval of the HPMP Stage-I, several activities have been undertaken by the Ozone Cell, MoEF&CC in close cooperation with the implementing agencies and stakeholders. A Stakeholders Workshop was organized in February, 2013 during which the HPMP Stage-I was launched and implementation of activities was initiated towards achieving the compliance targets for the HPMP Stage-I in accordance with the agreement signed between the Ex-Com of the MLF and the Government of India.

Phase-out activities in the Foam manufacturing sector

Conversion projects from HCFC 141b to non-ODS blowing agents have been successfully implemented in 8 domestic refrigeration, 2 continuous sandwich panel and 5 discontinuous sandwich panel sub-sectors. All the 15 enterprises have stopped using HCFC-141b as a blowing agent in the foam manufacturing sector from 1.1.2015. The phase-out as well as project

implementation has also been independently monitored and verified through a third-party consultant appointed by the UNDP.

Systems Houses assisted under the project have developed formulations based on HCFC free alternatives that can be adopted by the user enterprises. The use of non-ODS pre-blended polyols is finding acceptability and its penetration is determined by commercial factors. The System Houses have used Ecomate, Methylal and cyclopentane as blowing agents for developing pre-blended polyols.

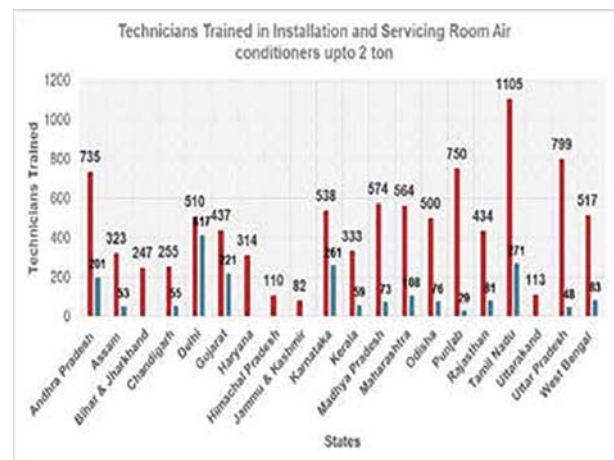

Phase-out activities in the RAC servicing sector

GIZ Proklima and UN Environment are cooperating agencies for implementation of activities under the servicing sector, which includes technicians training and awareness generation under the HPMP. GIZ Proklima has been entrusted with the responsibility to coordinate with UN Environment for the enabling component.

Implementation of technicians training programs

The training programs for the RAC technicians in room air conditioners up to 2 ton were conducted in the country, through two training modules, one module was for installers and the other module for service technicians. Both the training modules included theory classes and practical sessions. The trainings were conducted in urban and semi urban cities / towns in the country. The trainings were organized through the network of Training Partners and the team of trainers in the country. The trainers were trained through three Training of Trainers programs by leading international faculty/consultants, wherein, 50 trainers were trained. Training materials comprising presentations, handbook, to be used as a reference material, posters and stickers were developed for the technicians and the trainers. The handbook was prepared in English and Hindi. The performance

of the trainers and the quality of the training programs were monitored by external consultants. About 10% of the training programs were monitored. Each Training Partner was supported by set of equipment and tools required for conducting the practical / hands on training during the training programs. Under HPMP I, a total of 11,276 technicians through 408 training programs. Under the module for servicing - a total 9,240 technicians were trained through 332 training programs and under the module for installers - a total 2,036 technicians were trained through 76 training programs.

Strengthening of training for institutional users

Institutional users like Defence sector and Indian Railways have a substantial inventory of all their HCFC based equipment / appliances. Both defence sector and Indian Railways undertake phase-out measures as part of their institutional policy. Training programs were organized for technicians of both these users. One training program for the Defence sector and three training programs for the Indian Railways have been organized. The Government Industry Training Institutes (ITIs) trains students in the trade of RAC. Their present syllabus is proposed to be adapted to ODS free servicing and Good Service Practices for HCFC based systems. Discussions with the Directorate General for Employment and Training (DGET) officers were held for syllabus updation.

Reclamation Centres

Promotion of recovery and reclamation in the private sector on a pilot basis was initiated. This would facilitate assessment of loop holes and support required by the reclamation centres. Two regional workshops were organized. Observations and findings from these meetings and regional workshops were shared with the Core Group constituted for monitoring the implementation of the Montreal Protocol activities in the country.

Enabling Component (awareness and communication, enforcement training, capacity building and trade controls)

The UN Environment has been implementing activities under the enabling component for the servicing sector, building sector interventions, enforcement training, trade controls, policy and regulation and awareness generation. The following are the main activities that have been implemented:

Creating awareness among the RAC sector stakeholders by organizing workshops for RAC spare parts dealers, refrigerant suppliers, Heating, Ventilation and Air-Conditioning (HVAC) contractors, RAC associations viz. RAMA, Indian Society of Heating, Air-conditioning & Refrigeration Engineers (ISHARE), Academia, Customs, Environmental Non-Governmental Organizations (NGOs), Government officers and officials, service sector technicians, railways. The workshops covered topics relating to Good Servicing Practices, recovery, recycling and reclamation of refrigerants, alternative technologies and refrigerants, phase-out of HCFC, impact of ODS on the environment. The workshops highlighted on the upcoming challenges with respect to technology and emerging alternative refrigerants like Hydrocarbons and Hydrofluorocarbons (HFCs) and HFC blends, tools and equipment for good servicing and their demand by service technicians, strengthening adequate knowledge on issues of flammability, toxicity coupled with

impact on best operating practices of alternative refrigerants, preventing leakage of refrigerants during transfer from larger to smaller cylinders.

Refrigerant identifiers worth US\$140,000 were procured and supplied to the Customs. Refrigeration and Air-conditioning Service Sector Society (RASSS) was established and registered as a society under the Societies Registration Act (XXI of 1860) and as amended by Punjab Amendment Act, 1957. At present, the headquarters of RASSS is in Chandigarh with branches/chapters in the states of Punjab, Maharashtra, Uttarakhand, Haryana and Uttar Pradesh with over 400 members including 250 companies.

Flyers, Posters and Stickers were designed, printed and distributed during the technicians training programs to get them acquainted with the Good Servicing Practices, which have been explained through easy to understand caricatures.

To disseminate information about the project, its activities and other relevant information a website has been developed (www.rasss.org).

The remaining awareness activities include preparation of videos on Good Servicing Practices, newsletter to keep the technicians and concerned stakeholders up to date on upcoming alternative refrigerants, development of amendments for non-HCFC building codes and template for amending curriculum of architectural colleges to include ODS issues. These activities shall be completed by the end of 2017.

The enforcement capacity building with respect to mainstreaming HCFC issues/subjects in the general training curricula of National Academy of Customs Indirect Taxes and Narcotics (NACIN) has been initiated and is likely to be completed by the end of 2017.

Impacts of HPMP Stage-I

India successfully met the 2013 target of freeze of HCFC production and consumption and 10 %

phase-out targets of HCFCs in 2015, as per the accelerated phase out schedule of the Montreal Protocol.

Through the HPMP Stage-I, a total of 341.77 ODP tonne of HCFCs have been phased out, of which 310.53 ODP tonne is of HCFC 141b in the foam manufacturing sector and 31.24 ODP tonne is for HCFC-22 in the RAC servicing sector, in accordance with the agreement between the Government of India and the Ex-Com of the MLF. The net direct emission reductions are thus 3,071,260.5 CO₂ eq.tonne.

HPMP Stage-II

The Ex-Com of the MLF in its 72nd meeting held in May, 2014 has approved US \$ 490,000 for the preparation of HPMP Stage-II for India with UNDP as the lead implementing agency in association with UN Environment and GIZ, Government of Germany as cooperating agencies. The HPMP Stage-II would address phase-out of HCFCs in various sub-sectors of foam manufacturing, RAC manufacturing and RAC servicing sector. The HPMP Stage-II would also include strategy for awareness among the stakeholders and training of enforcement officers across the country.

The Ex-Com of the MLF during its 74th meeting held in May, 2015 approved the policy guidelines for HPMP Stage-II in the consumption sector.

In order ensure proactive involvement and ownership of HCFC phase-out by the industry, industry associations, namely, RAMA and IPUA, were involved in the HPMP Stage-II preparation process. Under the overall supervision and guidance of the, MoEF&CC, IPUA and RAMA were responsible for providing sector inputs for achieving HPMP Stage-II targets. They also had the responsibility for carrying out survey of the Foam and RAC sectors respectively and for information out-reach at the sector-level. The Implementing and bilateral agencies provided technical inputs, guidance for HPMP preparation process and inputs for HCFC phase-out.

To adequately inform the stakeholders of the

challenges and opportunities in complying with the phase-out schedule for HCFCs, 3 workshops each in foam and RAC sectors were held in Delhi, Mumbai and Chennai during October 2015 by the IPUA and RAMA for their respective sectors. The workshops were well-attended and served as a platform for both information outreach and exchange with participants on data collection process and the prevailing policy guidelines for HPMP. Inputs were provided by technical experts on industry trends and status of alternatives for various applications.

Appropriate questionnaires and formats for reporting information and data were developed in cooperation with the implementing agencies. IPUA and RAMA were engaged for collecting data at sectoral/sub-sectoral level and for developing sector-level strategies and recommendations, for achieving reductions in HCFC consumption. IPUA and RAMA engaged professional survey agencies for data collection at enterprise-level.

The data analysis at the sector level included classification based on historical and present HCFC consumption by sub-sector and application, eligible and ineligible enterprises and their consumption, projected growth trends until baseline and thereafter, required reductions in HCFC consumption for meeting the phase out targets as per the accelerated phase out schedule for HCFCs and availability of deployable alternative technologies for each sector/subsector. At the national level, data reconciliation was carried out through interactions with DGFT and Directorate General of Commercial Intelligence and Statistics (DGCIS), Ministry of Commerce and Industry and a draft HPMP stage-II was developed. A stakeholder's workshop was held on 5th August 2016 at New Delhi where in the draft HPMP Stage-II was presented. Based on the inputs from the workshop, the HPMP Stage-II was finalised and submitted to the Ex-Com of the MLF.

The Ex-Com of the MLF in its 77th meeting held

in December, 2016 approved India's HPMP Stage-II for the period 2016 to 2023 to reduce HCFC consumption by 60 per cent of the country's baseline and deduct 769.49 ODP tonnes of HCFCs from the remaining HCFC consumption with a funding of US \$48,315,261 including implementing agency support costs.

Approval of India's HPMP Stage II

India's HPMP Stage-II was considered and approved at the 77th meeting of the Executive Committee (Ex-Com) meeting of the MLF for Implementation of the Montreal Protocol held from 28th November to 2nd December, 2016 at Montreal, Canada.

Under HPMP Stage-II, India has secured 48.3 million USD from the MLF including implementing agencies support costs for the

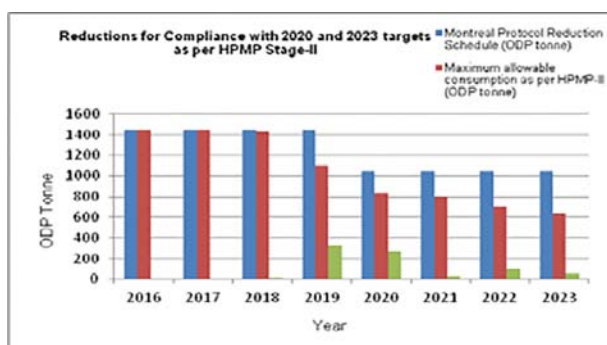

implementation of the Montreal Protocol for phasing out 8,190 MT of HCFC consumption between 2017 to 2023, in order to meet the compliance target under Montreal Protocol for 2020. Around 400+ enterprises including 300+ Micro, Small and Medium Enterprises (MSMEs) in the foam manufacturing sector and 6 large air conditioning manufacturing enterprises, who volunteered to participate, would be supported under HPMP Stage-II for conversion from HCFCs to non-HCFCs technologies.

HCFC Reductions through HPMP Stage-II

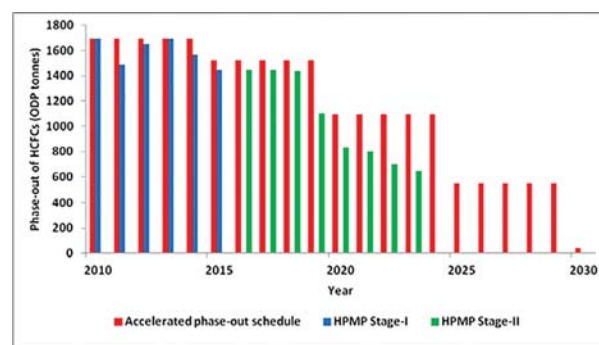

The required level of reduction in HCFCs consumption in the year 2020 as per the target under the Protocol and the allowable consumption of HCFCs in different years in the range of 2017 - 2023, as per the approved HPMP-II is given in table below.

Table 18: Reductions for Compliance with 2020 and approved targets as per HPMP Stage-II

S.No.	Particulars	2016	2017	2018	2019	2020	2021	2022	2023
1	Montreal Protocol Reduction Schedule (ODP tons)	1447.38 90% of baseline	1447.38 90% of baseline	1447.38 90% of baseline	1447.38 90% of baseline	1045.33 65% of baseline	1045.33 65% of baseline	1045.33 65% of baseline	1045.33 65% of baseline
2	Maximum allowable consumption as per HPMP-II (ODP tons)	1447.38 90% of baseline	1447.38 90% of baseline	1433.63 89.15% of baseline	1103.85 68.64% of baseline	832.32 51.75% of baseline	799.76 49.73% of baseline	698.82 43.45% of baseline	643.28 40% of baseline
l	Reductions Required (ODP tons)	—	—	13.75	329.78	271.53	32.50	100.94	55.54

Reductions for Compliance with 2020 and approved targets as per HPMP Stage-II

Impact of HPMP Stage-I And HPMP Stage-II in Phase-out of HCFCs

Impact of HPMP Stage-II

Ozone Layer Protection

Successful implementation of the HPMP Stage-II in India will result in a sustainable phase-out of 769.49 ODP tons of HCFCs.

Direct GHG emissions

Due to the relatively high GWP of HCFCs, their phase-out will result in reduced direct GHG emissions. The net contribution towards reduction of direct CO₂ emissions due to successful implementation of HPMP Stage-II are 4,262,100 MT CO₂ Eq. per year from 2020 and 7,697,600 MT CO₂ Eq. per year from 2023.

The HPMP Stage-II specifically focusses on the MSME sector in foam manufacturing. Adequate attention has also been given to synergize the RAC servicing sector training under HPMP Stage-II with the Skill India Mission of the Government of India, in order to multiply the impact of skilling and training. It is estimated that nearly, 16000 service technicians will be trained under HPMP-II.

The HPMP-II also provides for promotion of energy efficiency, development building codes integrating HCFC phase out issues, cold chain development with non-HCFC alternatives and development of standards for new non-ODS and low GWP alternatives, while transitioning away from HCFCs. It is expected that there would be a net direct CO₂-equivalent emission reductions of about 8.5 million metric tonne annually from 2023 onwards.

Under the Montreal Protocol, the accelerated phase out of HCFCs is underway with a phase out of HCFCs by 2030. HCFCs presently are being used in various sectors, inter alia including Refrigeration and Air conditioning sector, foam manufacturing sector etc. These sectors, as such, are cross-cutting and are directly related to sectors such as urban development, agriculture through cold chain sector, and industrial development. India is

undertaking phase-out of HCFCs through the implementation of HPMP.

The HPMP-II was launched on 6th March, 2017 at New Delhi by late Shri Anil Madhav Dave, the then Hon'ble Minister of Environment, Forest and Climate Change in a stakeholder meeting where officers of the Ministries and Organizations of the Central Government, State Governments, representatives from industries, stakeholders including NGOs and implementing agencies associated with the implementation of the HPMP II viz. UNDP, GIZ and UNEP, were present.

Launch of the HCFC Phase-Out Management Plan Stage - II in a function held on 6th March, 2017, at New Delhi, India

The UNDP appointed a third party for carrying out due diligence of the enterprises that participated in the survey carried out by IPUA for the foam manufacturing sector and the 6 enterprises that volunteered to participate in the HPMP Stage-II. Based on recommendations of UNDP on the third-party verification reports of enterprises, the Ozone Cell has initiated signing of Memorandum of Agreements (MOAs) with the enterprises in both foam manufacturing and air conditioning manufacturing sectors.

Project implementation agreements have been signed with the UN environment for the enabling activities and with the GIZ, Proklima, Government of Germany for activities in the RAC Servicing Sector.

As part of the implementation of activities in

the servicing sector, two Training of Trainers (TOT) workshops have been organized in Bengaluru and Jaipur during August 2018. The training programmes for the RAC technicians will commence from October 2018.

Fiscal Measures

The Government of India has granted exemption from payment of Customs and Excise duties on capital goods required for ODS phase out projects funded by the MLF since 1995. In 1996, the Government of India further extended the benefit of Customs and Excise duty exemptions for ODS phase-out projects which were not funded by the MLF. The benefit is available subject to the condition that enterprise gives clear commitment for stop using the ODSs in all future manufacturing operations after the completion of implementation of project(s).

The benefit of duty exemption has been extended for new capacity as well as expansion of capacity with non-ODS technologies since 1997.

The Indian financial institutions have decided not to finance/re-finance new ODS producing/consuming enterprises.

The Tariff Advisory Committee (TAC), a statutory body under the Insurance Act, 1938 has decided to grant suitable discounts on fire insurance premiums if alternative fire extinguishing agents are used in place of halons in fire extinguishing systems.

Ozone Depleting Substances (Regulation and Control) Rules, 2000

In accordance with the National Strategy for ODS phase-out, the MoEF&CC, Government of India, has notified Ozone Depleting Substances (Regulation & Control) Rules, 2000 in the Gazette of India on 19th July, 2000, covering various aspects viz. production, consumption, export and import of ODSs. These rules have been subsequently amended from time to time. Most recent amendment being in 2014.

Important provisions of the Ozone Depleting Substances (Regulation and Control) Rules, 2000

These Rules prohibit the use of CFCs in manufacturing various products beyond 1.1.2003 except in MDIs and for other medical purposes. Similarly, use of halons is prohibited after 1.1.2001 except for servicing. Other ODSs such as CTC and methyl chloroform and CFC for MDIs were allowed to be used upto 1.1.2010. Further, the use of methyl bromide has been allowed upto 1.1.2015. Since HCFCs are low-ODP substances and are also used as interim substitutes to replace CFCs, these are allowed to be used upto 1.1.2030 as per the Montreal Protocol accelerated phase-out schedule.

As per Rules, there is a need for compulsory registration of ODS producers, manufacturers of ODS based products, importers, exporters, stockists and sellers and the same provision is applicable to manufacturers, importers and exporters of compressors and other products containing ODSs. They are also required to maintain records and file periodic reports for monitoring production and consumption of ODSs. Enterprises which have received financial assistance from MLF for the implementation of the Montreal Protocol for switchover to non-ODS technology have to register the date of completion of their project(s) and declare that the equipments used for ODS have been destroyed. Creation of new capacity or expansion of capacity of manufacturing facilities of ODSs and ODS based equipment have been prohibited. Purchasers of ODSs for manufacturing products containing ODSs, are required to declare the purpose for which ODSs are purchased. All imports and exports of ODSs and products containing ODSs require a license.

The recommendation of the MoEF&CC is essential before issuing any license for import and export of ODSs and products containing ODSs by the Directorate General of Foreign Trade (DGFT), Ministry of Commerce and Industry.

These rules also specify phase-out dates for

different ODSs in manufacturing of products using these ODSs. In addition, these Rules also ban trade in ODSs with non-Parties.

Amendments

The Ozone Depleting Substances (Regulation & Control) Rules, 2000 have been amended in 2001, 2003, 2004, 2005, 2007 and 2014.

The 2001 Amendment extended the last date of registrations from one year to two years after the commencement of the Rules. The Amendment 2003 refers to a correction of a typographic error. The amendment 2004 specified the date of registration for substances listed in Group IV of Schedule I (CTC) and for substances listed in Group VI of Schedule I (HCFCs) on or before 31st December, 2004 and on or before 19th July, 2007 respectively. Subsequently, the Rules were amended in 2005, the registration date for substances listed in Group IV of Schedule I (CTC) was extended upto 31st December, 2005. The Rules were further amended on 18th September, 2007. As per the amended rules, registration has been extended for substances listed under Group I, Group II, Group III and Group IV upto 31st December, 2009, in case of substances in Group VI upto 31st December, 2039 and in case of substances in Group VIII upto 31st December, 2014 and the existing registered enterprises need not apply for renewal.

The Ozone Depleting Substances (Regulation and Control) Rules, 2000 have been amended to align with the accelerated phase-out of HCFCs. A draft amendment of ODS Amendment Rules, 2014 was prepared by the Ozone Cell, MoEF&CC and circulated among the concerned stakeholders, including industry associations, DGFT etc. Subsequently, a consultative meeting was organized in October, 2012 where a large number of stakeholders participated in the meeting to further discuss the salient features of the amendment.

The draft amendment was updated incorporating the inputs received from the participants during

the meeting and written comments sent by the participants. The draft amendment was submitted to the Ministry of Law and Justice for vetting after due approval of the then Hon'ble Minister for Environment, Forest and Climate Change.

The draft of amendment of Ozone Depleting Substances (Regulation and Control) Rules was published in the Gazette of India in May, 2013 for inviting comments/suggestions from the public on the draft Rules. Subsequently, the Ozone Depleting Substances (Regulation and Control) Amendment Rules, 2014 were published on 4th April, 2014 in the Gazette of India. The salient features of the Ozone Depleting Substances (Regulation and Control) Amendment Rules, 2014 are:

- The production and consumption of Group VI substances (HCFCs) has been proposed to be controlled according to the accelerated phase-out schedule of the Montreal Protocol.
- Introduction of quota system by the Government for production and consumption of Group VI substances (HCFCs) for non-feedstock applications and monitoring and reporting system for all feedstock applications including use of Carbontetrachloride in order to comply with phase-out targets of the production and consumption of Group VI substances (HCFCs).
- Prohibition of issuance of license for import and export for Group I, Group II, Group III, Group IV and blends containing ODSs including Group VI substances except recovered, recycled and reclaimed ODSs or for EUN, if any or ODSs for destruction or for feedstock applications.
- Prohibition of issuance of license for import of pre-blended polyols containing Group VI substances (HCFCs).
- Ban on creating new capacities to

manufacture products made with or containing Group VI substances (HCFCs).

- In order to control the inventory of HCFC based refrigeration and air-conditioning equipments and reduce the consumption of HCFCs in servicing of these equipments in future years, import of air-conditioning and refrigeration equipments and other products using HCFCs from 1st July, 2015 has been prohibited.
- Exemption for production of Group VI substances (HCFCs) for the Protocol approved feedstock uses in manufacturing of other chemicals, with negligible emissions, if any.

Kigali Amendment to the Montreal Protocol

It is significant to note that the negotiations for phasing down of HFCs under the Montreal Protocol were initiated way back in 2009, but these negotiations gathered momentum only after India submitted an amendment proposal for phase down of HFCs under the Montreal Protocol in April, 2015. The Indian Amendment proposal was crafted in a way to balance the needs of our rapidly growing economy and achieve maximum climate benefit. There were 4 amendment proposals viz (i) North American Proposal (Canada, USA and Mexico), Micronesia And Island States Proposals, Indian Proposal and (iv) European Union Proposal.

The issue of phase down of HFCs under the Montreal Protocol was also brought into focus through Joint Statement of Prime Minister of India and President of United State of America (USA) in June, 2016, wherein, it was resolved to work to adopt an HFC amendment in 2016 with increased financial support from donor countries to the MLF to help developing countries with the implementation, and an ambitious phase down schedule, under the Montreal Protocol pursuant to the Dubai Pathway, agreed by the 27th Meeting of Parties held at Dubai, United Arab Emirates from 1st to 5th November, 2015.

The 27th MOP decided to work within the Montreal Protocol to the HFC amendment in 2016 by first resolving challenges by generating solutions in the contact group on the feasibility and ways of managing HFCs at the Montreal Protocol meetings and then address the amendment proposals. It was also decided by the 27th MOP to hold a series of Open Ended Working Group (OEWG) and other meetings including an Extraordinary MOP in 2016.

In the two OEWG meetings (37th OEWG and Resumed 37th OEWG) the parties were able to address identified challenges for managing HFCs. During the 3rd Extraordinary MOP held in Vienna, a new joint proposal was submitted by USA, European Union, Japan, New Zealand, Australia (JUSSCANZ) according to which the developed countries had suggested one single common baseline years for production and consumption of HFCs for developing countries i.e. 2017-2018-2019 and freeze year as 2021. However, various developing countries proposed as many as six different baselines range from 2017 to 2030, and freeze year ranging from 2021 to 2031.

India represents only around 2% of the global production and consumption of HFCs but our manufacturing and consumption sector is expected to grow at a rapid pace in future. Our challenge, therefore, was to secure international agreement on a regulatory regime that served the global expectations and yet protect our national interest.

India has been a strong advocate of the principle of Common but Differentiated Responsibility in the matter of global actions to protect environment and also that national circumstances need to be factored in for arriving at any durable agreement related to climate.

At the commencement of negotiations in Kigali, India piloted realistic baseline of 2024-2026 for developing countries and which protects India's interests. As per the agreement reached in Kigali, India will freeze its manufacturing

and consumption of HFCs in 2028 and start reducing it from 2032 to 2047 with reference to the baseline years 2024, 2025 and 2026. The Freeze year is subject to technology review and could be further deferred to 2030. The agreement facilitates adequate carbon space for growth on domestic industry while minimizing the cost to the economy during the transition period.

India had consistently taken a position that the baseline and freeze years should be at such a future date which allows for growth of economy while minimizing cost to the economy. The Indian delegation also had steadfastly raised the issues of Intellectual Property Rights of non-HFC technologies, the high cost of these technologies and resultant cost to economy in transitioning away from HFCs.

In the Kigali Amendment, it has been agreed that the developing countries will have two set of baselines - one for the early movers in which case it will be 2020-2021-2022 and the other for those whose national circumstances were different and the manufacturing of HFCs and consumption in whose case was still rising in the absence of clear alternative technologies. In case of such countries the agreed baseline years are 2024, 2025 and 2026. An allowance of HCFC component of 65% was also added in the baseline of India in order to compensate for the upward movement of baseline years in Indian amendment proposal, the HCFC component was only 32.5%.

At the same time, it has also been agreed that the developed countries will reduce their production and consumption of HFCs by 70% in 2029. India will complete its phase down in 4 steps from 2032 onwards with cumulative reduction of 10% in 2032, 20% in 2037, 30% in 2042 and 85% in 2047.

The Montreal Protocol had no arrangement till date to incentivise improvement in energy efficiency in case of use of new refrigerants and technology. On India's initiative, it was

agreed in Kigali that the MLF under the Montreal Protocol will pay for maintaining or increasing the energy efficiency with new technology. Funding for R&D and servicing sector in developing countries has also been included in the agreed solutions on finance.

The amendment to Montreal Protocol agreed in Kigali has facilitated the creation of an international regime of regulatory actions and financial support for treating this set of chemicals in the same manner and with the same urgency as was accorded to other Ozone Depleting Substances in the past.

Details of the elements of the agreed HFC phase-down schedule are provided in table below:

	A5 parties (developing countries) - Group 1	A5 parties (developing countries) - Group 2	Non-A5 parties (developed countries)
Baseline formula	Average HFC consumption for 2020-2022+65% of hydrochloro-fluorocarbon (HCFC) baseline	Average HFC consumption for 2024-2026+65% of HCFC baseline	Average HFC consumption for 2011-2013 + 15% of HCFC baseline*
Freeze	2024	2028	-
1st step	2029 - 10%	2032 - 10%	2019 - 10%
2nd step	2035 - 30%	2037 - 20%	2024 - 40%
3rd step	2040 - 50%	2042 - 30%	2029 - 70%
4th step	-	-	2034 - 80%
Plateau	2045 - 80%	2047 - 85%	2036 - 85%

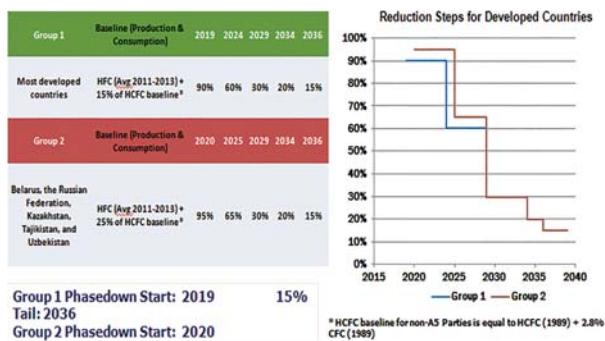

* For Belarus, Russian Federation, Kazakhstan, Tajikistan, Uzbekistan, 25% HCFC component of baseline and different initial two steps (1) 5% reduction in 2020 and (2) 35% reduction in 2025

Notes

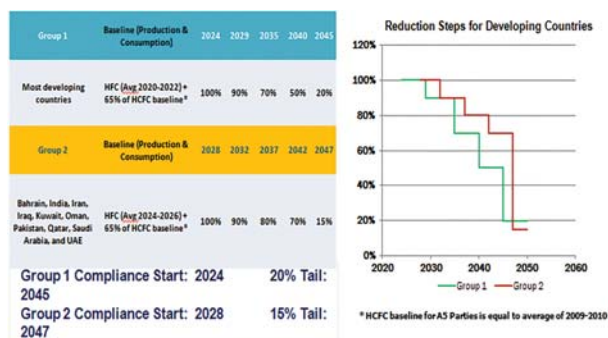

1. Group 1: Article 5 parties not part of Group 2
2. Group 2: Bahrain, India, the Islamic Republic of Iran, Iraq, Kuwait, Oman, Pakistan, Qatar, Saudi Arabia and the United Arab Emirates

3. Technology review in 2022 and every five years.
4. Technology review four to five years before 2028 to consider the compliance deferral of two years from the freeze of 2028 of Article 5 Group 2 to address growth in relevant sectors above certain threshold.

HFC Phase-down Schedule for Developed Countries

HFC Phase-down Schedule for Developing Countries

After the Kigali meeting a Note seeking ex-post facto approval of the Cabinet for the negotiating position of India with respect to the proposals for amendment to the Montreal Protocol of the Vienna Convention for Protection of Ozone Layer was submitted on 7th November, 2016.

The Cabinet considered the note and approved the proposals contained in of the Cabinet Note as 30th November 2016.

The success of negotiations at Kigali is a result of the spirit of collective action, accommodation and flexibility by all the parties to ensure the best possible outcome which addresses the needs of all countries and leads to maximum climate benefits.

India has been able to secure an agreement that provides adequate space for growth of our economy, while providing adequate time for industry to shift to sustainable alternatives in the interest of environment. The agreed arrangements will minimize the cost to consumers in transitioning away from HFCs and provide for domestic innovation to develop in the sector of new generation refrigerants and related technologies.

NEW INITIATIVES

India Cooling Action Plan

Cooling is an essential part for economic growth and development. in Article 5 countries. The Refrigeration and Air-conditioning sector is a major consumer of electricity. The direct and indirect emissions of the RAC Sector relate to use of refrigerants and energy consumed by the equipment. It is a widely known fact that about 90% of the total emissions from refrigeration and air conditioning equipment is because of energy consumption. The Kigali Amendment to the Montreal Protocol, for the first time, has recognized linkages between maintaining and/or improving energy efficiency of the RAC equipment with refrigerant transition under the Montreal Protocol.

Keeping in view that energy efficiency is a major driver for technology choice under the Kigali Amendment and considering the need for an integrated view to be taken with respect to cooling for maximization of climate benefits under the Kigali amendment, the Government of India has initiated the development of India Cooling Action Plan (ICAP), which provides a long-term perspective and guidance with respect to cooling needs. The proposed plan would integrate issues of energy efficiency, refrigerant transitions, technology choices, reduction of cooling load, focus on servicing sector, and having an innovation ecosystem for development low GWP technologies.

In order to develop the ICAP, a Focused Group

Discussion with industry and think tanks on the way forward was held on 16th October 2017, which was followed by stakeholder discussion on ICAP framework on 20th Dec. 2017. A national level stakeholder consultation was held on 17th January 2018 where more than 80 experts from industry, academia, think tank, and different ministries participated.

After these detailed stakeholder consultations, the Ministry constituted seven thematic working groups on 6th February 2018 with detailed terms of reference to prepare thematic documents / reports on the following (i) space cooling, (ii) cold chain, (iii) air conditioning and refrigeration technology, (iv) R&D and Production Sector - Alternative Refrigerants and technologies, (v) Servicing Sector, (vi) Transport Air conditioning (car, bus, train and Metro air conditioning) and (viii) Cross cutting policy regulation and other international Conventions. The thematic groups have been meeting regularly for development of documentation along with an action Plan for Short, medium and long-term interventions, which would then be integrated into the NCAP. Each of the thematic groups comprise representatives from government Departments/ organizations, industry, R&D institutions, academia, individual experts and think tanks.

The ICAP shall provide a perspective plan 20-year perspective plan (2018-2038) and policy recommendations, to address the cooling requirement across sectors while providing for ways and means to provide thermal comfort and access to sustainable cooling to all, involving multi-stakeholders to synergize actions for addressing cooling demand across all areas: technology, manufacturing, energy efficiency and the environment, while reemphasizing the principles enshrined in the Country Programme of India for phase out of ODS i.e. to have minimum economic dislocation and obsolescence cost and maximize indigenous production to twin environment and economic gains.

Given the cross-cutting nature of cooling demand, the ICAP implementation proposes active collaboration among the relevant ministries as well as the private sector entities. The draft ICAP will be launched on the World Ozone Day after which comments will be invited. The ICAP will be finalized after appropriately incorporating the comments.

Training and Certification of Refrigeration and Air-conditioning Service technicians under Skill India Mission

Air conditioning and refrigeration is an important and critical sector both for social and economic development in the country. Air conditioning is becoming a necessity for healthy working and living environment, and refrigeration is an essential component of the cold chain for the preservation and distribution of perishable food. Servicing sector is important not only because it consumes a large proportion of the total consumption of refrigerants like HCFCs and HFCs but also it has been the major source of emissions of these chemicals to the environment in the country. The quality of servicing would also maintain the energy efficiency of the serviced equipment resulting in saving in electricity consumption. The use of proper servicing practices would not only result in savings in refrigerant and consumption and emissions but also reduce electricity consumption in the serviced equipment. Most of the technicians engaged in this sector are from the unorganized sector without formal technical education and/or training and these technicians have learnt by working in the field over several years.

It is estimated that there are more than 200,000 RAC service technicians in the country with most of them being in the informal sector. The current penetration of ACs in the country is around 4-6%. It is projected that there would be a rapid increase in the AC penetration. This would also lead to increase in the number of RAC technicians.

The Ozone Cell, MoEFCC had developed a project jointly with the Electronic Sector Skill Council of India (ESSCI) for upskilling and certifying 100,000 RAC service technicians under the Skill India Mission - Pradhan Mantri Kaushal Vikas Yojana (PMKVY) of Ministry of Skill development. Through this proposal not only the livelihood opportunities of the RAC service technicians working in the informal sector would be enhanced through upskilling and certification but most importantly this would have significant positive environmental impacts through reduction leakage of refrigerants and increase in the energy efficiency in the operation of RAC equipment.

The project was launched on 2 August 2018 in the presence of Hon'ble Minister for Environment, Forest and Climate Change, Hon'ble Minister for Skill Development and Entrepreneurship (MSDE) and the Hon'ble Minister of State for Environment, Forest and Climate Change. A Memorandum of Understanding between the MoEF&CC and MSDE for implementing the project was signed by the Joint Secretaries of the two ministries during the launch function. Implementation of the project has begun and Training of Trainers programmes are currently under implementation.

PARTICIPATION IN MONTREAL PROTOCOL MEETINGS

Meetings of the Executive Committee of the Multilateral Fund for the Implementation of the Montreal Protocol - Significant Outcomes

As per the Kigali Amendment to the Montreal Protocol, the Executive Committee of the Multilateral Fund for the Implementation of the Montreal Protocol is to develop cost guidelines for phasing down of Hydrofluorocarbons (HFCs) in the production, consumption and servicing sectors in the developing countries by 2018. These cost guidelines shall operationalize the funding solutions agreed as part of the Kigali

Amendment and shall determine the quantum of funding, which shall be made available by the developed countries to the Multilateral Fund for supporting HFC phase down activities in the developing countries.

The negotiations on the cost guidelines started since April 2017, India actively participated in the deliberations on the cost guidelines and has in the 80th and 81st meetings, able to secure the incorporation of provision for adequate funding for energy efficiency and servicing sector in the negotiating text of the Cost Guidelines. In addition, India was able to make the ExCom agree for undertaking comprehensive deliberations on phaseout of HFCs in the production sector. The importance of these negotiations is that these cost guidelines when developed shall be used to provide funding to projects from developing countries including from India by MLF under HFC phase down. India also actively pursued for an assessment to be undertaken by the MLF Secretariat the issue relating to closure of HCFC-22 Production swing plants and while doing so, there should be no disincentive for pro-active actions taken by any Party.

Conference of the Parties to the Vienna Convention on the protection of the ozone layer and MOP to the Montreal Protocol

Meeting of the parties (MOP) to the Montreal Protocol - Significant Outcomes

Energy efficiency

On India's initiative, it was agreed in 2016 at Kigali, Rwanda that the Multilateral Fund shall develop a cost guidance for maintaining or increasing the energy efficiency in the refrigeration and air conditioning equipment while making refrigerant transition while phasing down HFCs under the Montreal Protocol.

In order to operationalize this decision, India introduced a Conference Room Paper (CRP) with other proponents in the 39th Open Ended

Working Group (OEWG) held from 11th to 14th July 2017 on the issues related to financial and technical support for energy efficiency in Article-5 Parties (developing countries).

The CRP was considered and deliberated in the 29th Meeting of Parties to the Montreal Protocol (MOP) held from 20th to 24th November 2017. A contact group to further discuss the CRP submitted by India along with Bahrain, Kuwait, Lebanon and Saudi Arabia and African States was established during the MOP. The developed countries were initially not so forthcoming on the issue, emphasizing that Energy Efficiency has not been dealt under the Montreal Protocol earlier and is not compliance target under the Kigali Amendment, which deals with phasedown of HFCs. Also, many other bodies provide funding for energy efficiency. Further it was emphasized that the scope of the topic is wide much beyond the jurisdiction of the Protocol.

The Indian delegation actively and forcefully put forth the view that the Kigali Amendment has formalized and enshrined maintaining and/or enhancing energy efficiency of refrigeration and air-conditioning equipment while making refrigerant transitions in the Montreal protocol. Also, that the Kigali Amendment deals with climate impacts and global warming potential. Thus, Energy Efficiency of RAC equipment while making refrigerant transition is an integral part of the Kigali Amendment and needs to be dealt under the protocol. The important aspect is to clearly define the scope of technology requirements and the associated costs through a focused study of TEAP, before the 40th OEWG meeting in July 2018 in Vienna.

India was able to pilot after sustained and intensive negotiations the adoption Decision XXIX/10 in the MOP emerging out of the CRP on the issues related to financial and technical support for energy efficiency in Article-5 Parties submitted by India and other proponents.

Vide Decision XXIX/10 of the MOP, the

Technology and Economic Assessment Panel of the Montreal Protocol shall inter alia assess (i) Technology options and requirements, (ii) Related costs including capital and operating costs, (iii) Capacity-building and servicing sector requirements in relation to maintaining and/or enhancing energy efficiency in the refrigeration, air-conditioning and heat-pump sectors and submit a comprehensive to the Parties for further consideration. In addition, the Ozone Secretariat shall hold an international workshop on the subject for the Parties in Vienna in July 2018.

This is a significant first step in operationalization of dovetailing energy efficiency and refrigerant transition under the Montreal Protocol framework, which will significantly enhance the overall climate benefit.

Replenishment of the Multilateral Fund for the period 2018-2020

The Multilateral Fund provides funding to the developing countries for transitioning from ODS to non-ODS technology. India was one of the members of the contact group formed by the MOP to finalize the level of replenishment of the MLF by the developed countries. India played a key role in the discussion on the replenishment. The Contact Group met several times and discussed various elements and arrived at a figure of US \$540 million replenishment of the MLF for the triennium 2018-2020. It may be mentioned here in the prevailing international regime a replenishment of 540 million USD for the 2018 to 2020 of the MLF is a very significant achievement. The decision to this effect was adopted by the high-level segment of the 29th MOP.

High level Segment of Conference of the Parties to the Vienna Convention on the protection of the ozone layer and Meeting of the parties (MOP) to the Montreal Protocol

Secretary, EF&CC made the statement during

the high level segment of 29th MOP on behalf of India. Secretary, MoEFCC also participated in Ministerial Round-table in the High Level Segment of MOP on "Identifying future opportunities and priorities" wherein he underlined the past successes of the Montreal Protocol highlighting the key points which led to its success globally and in India which were wide and comprehensive stakeholder participation and technical and financial assistance mechanism under the Protocol. He also set forth the future opportunities and priorities under the protocol including for effective implementation of the Kigali Amendment. Many of the ideas stated by Secretary EFCC were echoed by Mr. Erik Solheim, Executive Director, UN Environment.

Ministerial Round-table discussion, on "Identifying future opportunities and priorities"

Round-table discussion, on the theme "Identifying future opportunities and priorities", was held on the morning of 23 November 2017. Secretary Ministry of Environment, Forest and Climate Change, Mr. C.K. Mishra participated in the same on behalf of India.

India was able to successfully underline the past successes of the Montreal Protocol highlighting the key points which led to its success globally and in India which included wide and comprehensive stakeholder participation and technical and financial assistance being the key. The future opportunities and priorities under the protocol

including for effective implementation of the Kigali Amendment were also articulated. Many of the ideas stated by Secretary EFCC as head of Indian Delegation were echoed by Mr. Erik Solheim, Executive Director, UN Environment.

Side Event on an Integrated Approach to Cooling: Maximizing Climate Benefits under the Kigali Amendment

MoEFCC, Government of India and UN Environment OzonAction's Compliance Assistance Programme, successfully organized a side event during the margins of the High-Level Segment of the Joint 11th COP to the Vienna Convention and 29th MOP to the Montreal Protocol organized a side event on 23rd November 2017 on the theme "An Integrated Approach to Cooling: Maximizing Climate Benefits under the Kigali Amendment".

Executive Director, UN Environment, Mr. Erik Solheim was the Chief Guest. The Side event was attended by Mr. Gilbert Bankobeza, Chief Legal Officer, Ozone Secretariat, Ms. Shamila Nair Bedouille, Head, OzonAction Branch, UN Environment. Secretary EFCC was also present. The event was well attended by Parties, Think tanks, representatives of UNDP, GIZ other multilateral and bilateral agencies, and industry representatives.

The Side event highlighted the steps taken by the Ministry to follow an integrated approach to cooling for maximizing climate benefits under the Kigali Amendment recognizing the cross sectoral nature of cooling. The importance of a detailed understanding of the cooling requirement and better technological options to address the cooling need was underscored. The need for an integrated solution to the cooling requirement of the country was stressed as the "Whole is greater than sum of the parts". The initiative of Ministry of Environment, Forest and Climate Change to develop a National Cooling Action Plan which integrates energy efficiency as key part of the solution for cooling, has a long term integrated

Ministerial Round table organized during the high level segment of the 29th MOP on 23rd November, 2017

perspective, focusses on maximizing climate benefits through energy efficiency, promote smart space cooling and refrigerant strategies, give a push to skilling in service sector, have an innovation ecosystem for development of low GWP alternatives to high GWP HFCs was highlighted at this important forum.

Late Shri Anil Madhav Dave, the then Hon'ble Minister of State (independent charge) environment, forest and climate change, Government of India was given the Ozone Award under the Political Leadership category for the Leadership provided by India during the Kigali Amendment Negotiations during the High-level Segment of the 29th MOP.

Meeting of the Open-Ended Working Group of the Parties to the Montreal Protocol

India continued its intensive negotiations on the issue of energy both during the workshop on energy efficiency opportunities while phasing down HFCs organized prior to the 40th OEWG as well as during the meeting of the OEWG. Stating that the TEAP provided information on energy efficiency issues in more general. India emphasized that the TEAP had not considered the relative performance of alternative low GWP substances. The criteria and methodology used for assessing projects is not clear. While the funding proposed is miniscule, the challenges and opportunities regarding energy efficiency need to be brought out clearly. India proposed for inclusion in the updated report of the TEAP, to be presented to the 30th MOP scheduled to be held in November 2018 at Quito, Ecuador (a) an assessment of relative performance of alternatives to various options regarding energy efficiency, including capacity, which the TEAP reported in its 2009 progress report. (b) clear and concise technical information on the technology options and requirements as well as the associated challenges (c) a matrix for the different technological interventions and their costs with respect to maintaining / enhancing energy efficiency while phasing

down HFCs (d) to quantify the context/site specific impacts on environmental benefits of Energy Efficient equipment and (e) to address the 'price hump' for uptake of energy efficient technologies and finance measure to overcome the 'price hump'.

Awareness Generation

The National Ozone Unit (NOU) has undertaken comprehensive public awareness campaign to ensure that the industries and public at large are aware about the ill effects of ozone depletion, and undertake necessary ODS phase-out activities and support the policies to protect the ozone layer.

World Ozone Day

World Ozone Day is organized every year in the country on 16th September, since 1995.

30th anniversary of the Montreal Protocol and 23rd World Ozone Day was celebrated on 16th September 2017 at Convention Centre, India Habitat Centre, New Delhi.

A pan-India awareness campaign launched by the Environment Ministry on the occasion of the 30th Anniversary of the Montreal Protocol. This campaign was among the most widespread countrywide engagements of the Ministry for awareness generation, carried out with the active partnership of States through schools and academic/research institutions spread across the country. The awareness campaign saw participation of students from more than 13,000 schools and reached out to 214 districts across 16 states of the country. Competitions were held in various states and awards were given to prize winning students at the state level.

The awareness campaign was implemented with active collaboration from State Governments, Regional Offices of the Ministry, Subordinate organizations and Autonomous bodies of the Ministry, State Nodal Agencies under the National Green Corp Scheme of the Ministry,

and the ENVIS centers spread across the country.

A special website was created for wider participation and engagement of stakeholders and students across the country.

On occasion of the World Ozone Day, the publication "Montreal Protocol: India's Success Story" was released giving latest information on ODS phase-out in the country and technologies adopted for phasing-out of ODSs. In addition, poster design, painting, slogan writing competitions were organized among school children. Prizes for the winning entries in each category of the competitions were awarded by the Chief Guest. Ten special information posters for school students were developed on Montreal Protocol and these were disseminated across the country.

Release of "The Montreal Protocol: India's Success Story" during "30th Anniversary of the Montreal Protocol and 23rd World Ozone Day for the Preservation of the Ozone Layer" function held on 16th September, 2017 at New Delhi, India

Piquor - online selfie stand and infographics relating to past achievements of Montreal Protocol were arranged for wider public engagement.

An "Ozone2Climate Technology Roadshow" was also organized to showcase technologies which are based on non-ozone depleting substances with low global warming potential. The Roadshow was organized in association with RAMA, IPUA, EESL, GIZ and UNDP. The exhibitors, showcased current refrigeration and

air conditioning equipment, designed to be more energy efficient that promoted ozone and climate-friendly alternative technologies to HCFCs and HFCs in the RAC sector.

The following two videos were launched on the Ozone Day:

- India's achievements in implementation of Montreal Protocol, and
- HCFCs phase-out and Energy Efficiency in buildings.

Handbook on HCFC Phase-out and Energy Efficiency in Buildings and the first edition of 'newsTRAC; and a newsletter for service technicians in Refrigeration and Air-conditioning (RAC) sector were released by the Hon'ble Minister EFCC on the occasion.

News letter

A newsletter for service technicians in Refrigeration and Air-conditioning (RAC) sector was launched on the World Ozone Day on 16th September 2017. Three issues of the newsletter have been published and widely circulated.

Participation in ACREX 2018

The Ozone Cell, MoEFCC along with UNDP, UN Environment and GIZ participated in ACREX 2018 in Bangalore. ACREX 2018 is Asia's largest exhibition of Heating, Ventilation Air-conditioning and Refrigeration (HVACR) industry. The Exhibition was inaugurated by Hon'ble MEFC and Executive Director, UN Environment. The focus of the exhibition was on Heating, Ventilation Air-conditioning and Refrigeration (HVACR), including green and energy efficient buildings and the cold chain.

An Ozone2Climate Industry Roundtable with the theme "Innovations in Energy Efficient and Climate Friendly HVAC&R Technology in India" was organized on 22nd February 2018. The objective of the Roundtable is to engage stakeholders including industries in a discussion on zero-ODP, low-GWP and energy

efficient alternatives in Heating, Ventilation, Air-conditioning and Refrigeration (HVAC&R) sector while considering the whole life cycle assessment of the climate impact of the final product.

Meetings

- Interagency meeting with UNDP, UN Environment and GIZ was held on 18th September, 2017 under the Chairmanship of Shri A. K. Jain, Additional Secretary, MoEF&CC.
- Meeting of the Committee on Monitoring was held under the Chairmanship of Chairman, Central Pollution Control Board.
- A Focused Group Discussion with industry and think tanks on way forward to National Cooling Action Plan was organized under chairmanship of Shri Anil Jain, Additional Secretary, MoEF&CC on 16th October 2017.
- A meeting with industry stakeholders to discuss issues relating to 80th Meeting of the Ex-Com and 29th MOP was held under the Chairmanship of Shri A. K. Jain, Additional Secretary, MoEF&CC.
- A meeting to review the Montreal Protocol projects and activities implemented by UNDP as lead agency was held on 1st December 2017 under the Chairmanship of Mr. Gyanesh Bharti, Joint Secretary, MoEF&CC.
- A meeting with industry stakeholders to discuss the outcomes of the 80th Ex-Com and 29th MOP was held under the Chairmanship of Mr. Gyanesh Bharti, Joint Secretary, MoEF&CC.
- A review meeting with UNDP to discuss progress of MLF Projects implemented by UNDP under the Chairmanship of Shri Gyanesh Bharti, Joint Secretary, Ministry of Environment, Forest and Climate Change (MoEF&CC) was held on 27th December 2017.
- A National Stakeholder consultation meeting on National Cooling Action Plan was held on 17th January 2018 under chairmanship of Shri Anil Jain, Additional Secretary.
- A meeting of the apex committee for the NCAP was held on 1st March 2018 under the Chairmanship of Shri. C.K. Mishra, Secretary, EFCC.
- Several meetings of the thematic groups of the NCAP were organized from February to August 2018 to discuss the progress of the NCAP.
- Meeting of the Empowered Steering Committee (ESC) for Implementation of the Montreal Protocol was held on 26th March 2018 under the Chairmanship of Mr. C.K. Mishra, Secretary, EFCC.
- Two meetings of the Technology and Finance Standing Committee were held on 21st September, 2017 and 16th February, 2018.
- Meeting of the Steering Committee under the Chairmanship of Mr. A.K. Jain, Additional Secretary was held on 29th July 2018 wherein the draft document of each thematic group was reviewed.
- Several consultative meetings were organized on a regular basis for interaction with industry, Government departments etc., on issues relating to Montreal Protocol Implementation.
- Several meetings were held with the officials of Electronics Skill Sector Council of India on the Project for upskilling and certifying 100,000 RAC service technicians under the Skill India Mission

Workshops

- Four workshops were conducted in collaboration with EESL on HCFC phase-out, energy efficiency in building sector at Delhi, Mumbai, Chennai and Kolkata.

- As part of the non-investment component of HPMP Stage-I, Regional Awareness workshops have been organized in across the country in association with GIZ Proklima and UN Environment Compliance Assistance Program (CAP), Regional Office for Asia and the Pacific (ROAP), Bangkok.
- Two workshops at Chennai and Ludhiana were organized by the RASSS wherein the two new chapters were also started at these two locations.
- Training, workshops were organized across the country for RAC servicing technicians by GIZ, Government of Germany as part of the remaining activities in the RAC Servicing Sector strategy of HPMP Stage-I.
- A Risk Profiling workshop was held in collaboration with UN Environment Bangkok from 20-22 June, 2018 which was attended by about 20 participants including 7 participants from NACEN India.
- Workshops on technology policy and awareness among stakeholders have been organized from time to time across the country for successful implementation of the phase-out of HCFCs as per the Montreal Protocol schedule.

Refrigeration and Air-Conditioning Servicing Sector Society

The servicing sector comprises of servicing enterprises and service technicians which are mostly from unorganized and informal sector and are spread all over the country.

UNEP Regional Office for Asia and the Pacific under the guidance of the Ozone Cell, MoEF&CC encouraged the servicing sector to form Refrigeration and Air-Conditioning Servicing Sector Society (RASSS). Presently RASSS has about 1500 members and 5 chapters.

Website

The Ozone Cell first launched its website

www.ozonecell.com in the year 1999. An interactive website of Ozone Cell has been re-developed.

MIS for ODS phase-out activities

A comprehensive MIS for all activities relating to ODS phase-out including the regulatory framework under the ODS Rules, project implementation and monitoring has been developed.

Monitoring System in India

A detailed monitoring mechanism has been established by the Ozone Cell, MoEF&CC to ensure that the funding support provided from the MLF through implementing agencies is being fruitfully utilized by the enterprises. The key aspects relating to monitoring mechanism are as follows:

The MoEF&CC has constituted a Standing Committee on Monitoring under the Chairmanship of Chairman, Central Pollution Control Board (CPCB) with Members from concerned Departments, Industry Associations and the Ozone Cell, MoEF&CC. The Committee reviews the data collected and analysed by the Ozone Cell, MoEF&CC from ODS producers, DGFT, Directorate General of Commercial Intelligence and Statistics (DGCIS), etc., on production, imports, exports and user industry in the country. The production, import and export data is collated in the Article 7 format of the Montreal Protocol for submission to the Ozone Secretariat. The Standing Committee on Monitoring is an advisory body to the ESC. The Article 7 data thus vetted by the Standing Committee on Monitoring is submitted to the ESC for its approval and then it is submitted to the Ozone Secretariat.

The Ozone Cell has been convening regular meetings with representatives of the World Bank, UNDP, UNEP, UNIDO and Bilateral Agencies with a view to note the progress of implementation and to sort out short term

problems, which might occur during the implementation process. Further, Director, Ozone Cell, MoEF&CC is holding periodic meetings with industries to monitor their implementation progress for ODS phase-out.

Awards and Recognitions

The Ozone Cell of India has been conferred with several awards/appreciations/recognitions for successful implementation of the Montreal Protocol and its ODS phase out activities.

Late Shri Anil Madhav Dave, the then Hon'ble Minister of State (independent charge) environment, forest and climate change, Government of India was given the Ozone Award under the Political Leadership category for the Leadership provided by India during the Kigali Amendment Negotiations.

On behalf of India, the award was received by Secretary, Ministry of Environment, Forest, and Climate Change. The Award ceremony was held in Montreal during the first day of high level segment of 29th MoP.

Secretary, Ministry of Environment, Forest, and Climate Change Shri C. K. Mishra receiving the Political Leadership Award on behalf of Late Shri Anil Madhav Dave during the high level segment of 29th MoP.

Other activities

- Recommendations were issued to enterprises for import and export of ODSs and ODS based equipment for getting license from the Directorate General of Foreign Trade (DGFT).

- A team from the Secretariat of the Multilateral Fund (MLF) for implementation of Montreal Protocol led by the Chief Officer, Mr. Eduardo Ganem visited India during the period 12-16 February 2018 to understand India's efforts to adopt Ozone Depleting Substances (ODS) free, low-Global Warming Potential (GWP) technologies in different sectors. The visit was organized pursuant to the visit of Secretary, Ministry of Environment, Forest and Climate Change (MoEF&CC) to the MLF Secretariat during September 2017, wherein an invitation was extended to the MLF Secretariat to visit India.
- The Senior Monitoring and Evaluation Officer, MLF accompanied by an independent consultant visited India during March 2018 for evaluation of RAC servicing sector implementation under HPMP Stage-I. During the mission, the team visited a sample of three training sites in three cities (Chandigarh, Bangalore and Ahmedabad) and collected information through direct observation and discussions with the stakeholders. Discussions were also held with the Ozone Cell and the bilateral implementing agency (GIZ) representatives. The team also had interaction with the officials of National Academy of customs and Indirect Taxes and Head UN Environment India office on implementation of the enabling component.
- Data on production, consumption, export and import of ODSs is being collected from various sources, collated and submitted to the Secretariat for the Vienna Convention and the Montreal Protocol (The Ozone Secretariat) and the Country Program Progress Report (CPPR) to the Secretariat of the MLF for the implementation of the Montreal Protocol by the end of September each year as per the Article 7 of the Montreal Protocol.

Key to Success

India attributes its success in achieving rapid progress of ODS phase out on the following:

- Identifying the priority sub-sectors for early phase-out.
 - Choosing wisely a project portfolio with the right mix of investment and non-investment activities.
 - Involving key stakeholders early in the phase-out process at both planning and implementation levels.
 - Sending clear messages from the Government to various stakeholders by notifying appropriate regulations and policies.
- Awareness raising activities for key target groups.
 - Increasing the capacity of the Ozone Cell by its active involvement in the Regional Network of ODS officers and other international fora.
 - To create awareness among the stakeholders producing and consuming HCFCs.
 - Monitoring of production and consumption sectors for complete phase-out of ODS.
 - Mechanism for more involvement of State level organizations in ODSs phase-out activities.

3. INDIA'S ACHIEVEMENTS TO DATE OF THE MONTREAL PROTOCOL REGIME

Achievements

Contribution and achievements of India for the protection of the stratospheric ozone and implementation of the Montreal Protocol are multi-fold. ODS producing and consuming industry in the country were motivated by creating extensive awareness about the ill effects of the ozone layer depletion in the early stage of the Montreal Protocol. Simultaneously, activities related to the Montreal Protocol were initiated as early as in 1989 by establishing a task force for evaluating the use of ODSs and estimating sector wise consumption of ODSs.

India not only developed and put in place policies/regulations for phase-out of ODSs as per the Montreal Protocol Schedule within the country, but also played a visionary role since the inception of the Montreal Protocol including in the key policy negotiations on behalf of the developing nations.

India debated extensively to make industrialized countries to realize their historic responsibility for production, consumption and emissions of ODSs, that has caused the stratospheric ozone hole. Subsequently, India played a vital role for setting up the financial mechanism as early as 1990 to provide technical and financial assistance to the developing countries. Today, the financial mechanism has proved to be the key element in making the Montreal Protocol a successful Environmental Treaty.

India became a Party to the Vienna Convention for the Protection of the Ozone Layer on 18th March, 1991 and the Montreal Protocol on Substances that Deplete the Ozone Layer on 19th June, 1992. India, during the last 23 years has made outstanding contributions for the protection of ozone layer.

Comprehensive Ozone Depleting Substances (Regulation and Control) Rules, 2000 were

developed and put in place under the Environment (Protection) Act 1986, which were utmost important for the successful implementation of ODS phase-out in a vast country like India. These rules set the deadlines for phasing-out of various ODSs. The unique feature of these Rules was banning the use of CFCs and halons in manufacturing of new equipment as early as from 1st January, 2003. This has not only achieved the early phase-out of CFCs and halons in the country, but also reduced the inventory of ODS based equipment which resulted in reduction of servicing requirements.

Another significant achievement was phase-out of production and consumption of virgin halons as early as 2002, being high-ODP chemicals.

India had successfully organized the 18th MOP to the Montreal Protocol, 50th Meeting of the Ex-Com of the MLF and 37th Meeting of the Implementation Committee during October-November 2006. The High Level Segment of the MOP was inaugurated by the then Hon'ble Prime Minister of India and the preparatory segment by the then Hon'ble Minister of Environment, Forest and Climate Change. A large number of Ministers of various countries headed their delegations to the MOP. The Ozone Secretariat and the Parties to the Montreal Protocol appreciated the arrangements of the meeting and hospitality of the country.

India accelerated the phase-out of production and consumption of CFCs with effect from 1st August, 2008, 17 months ahead of the Montreal Protocol schedule except use of pharmaceutical grade CFCs in manufacturing of MDIs for Asthma, COPD and other respiratory ailments within the country and other Article 5 Parties.

The Ozone Cell, MoEF&CC received "The Montreal

Protocol Implementers Award, 2007" on the occasion of 20th Anniversary of the Montreal Protocol, for its extraordinary contributions in the effective implementation of the Montreal Protocol and the global effort to protect the ozone layer. "The Stratospheric Ozone Protection Award, 2008" was also conferred on Dr. A. Duraisamy, Director, Ozone Cell in recognition of his exceptional contribution to global environmental protection and for leadership in ozone layer protection by United States Environmental Protection Agency, Washington, DC.

The phase-out of ODSs in MSMEs, which were widely scattered were handled using an innovative approach, realizing that MSMEs are having relatively a large share in Indian economy. Several sector-wise umbrella projects were formulated in a number of sectors viz. aerosol sector, foam manufacturing, refrigeration manufacturing, to cater to the needs of MSMEs. These enterprises were provided need based appropriate equipment for converting their operations from ODS to non-ODS technologies. Safety issues in using flammable propellants like Hydrocarbon Aerosol Propellant (HAP) by small aerosol fillers were addressed adequately.

The phase-out of use of CFCs in RAC Servicing Sector was an extremely challenging task because it involved the informal sector comprising of a large number of very tiny enterprises. These enterprises were located throughout the country, including in small towns and rural areas. NCCoPP and its forerunning projects (ECOFRIG and HIDECOR) not only addressed this sector in a very effective manner by training more than 20,000 servicing technicians but also provided equipment support to a large number of enterprises. This was one of the significant achievements addressing the informal sector in the country.

Another challenging task was to phase-out the production and consumption of CTC, especially

in the consumption sector which involved a large number of MSMEs and tiny enterprises using CTC as solvent. This sector was successfully addressed through an umbrella project and provided technical assistance to replace CTC used in garment manufacturing as well as metal cleaning.

India successfully phased-out the production and consumption of CFCs, CTC and halons as of 1st January, 2010.

Another critical challenge was to phase out the use of pharmaceutical grade CFCs in manufacturing of MDIs. The National Strategy for Transition to Non-CFC MDIs and Plan for Phase-out of CFCs in the Manufacture of Pharmaceutical MDIs was implemented by UNDP as lead implementing agency, in association with UNEP and Government of Italy in close cooperation of MDI manufacturers under the guidance of Ozone Cell, MoEF&CC. The MDI manufacturers have done a commendable work and converted all the CFC based formulations of MDIs to CFC-free and placed in the market as early as in 2011 with the due approval of Central Drug Standard Control Organization, MoHFW. India sought pharmaceutical grade CFCs through EUN only for 2010 and withdrew the nominations for 2011 in consultation with MDI manufacturers. Accordingly, India informed the 22nd MOP to the Montreal Protocol that India would not seek any CFCs for manufacturing of MDIs through EUN for 2011 and beyond. The 22nd MOP congratulated India for its outstanding contribution and achievement in this area.

The implementation of National Strategy for Transition to non-CFC MDIs and Plan for Phase-out of CFCs in Manufacturing of Pharmaceutical MDIs has resulted successful phase-out of pharmaceutical grade CFCs in manufacturing of MDIs as of December, 2012, 11 months prior to the schedule approved by the Ex-Com of the MLF. India was one of the first countries to switch over from CFC to non-ODS in MDI manufacturing.

Recognizing the importance and challenges in implementation of the accelerated phase-out of HCFCs as per the decision of the 19th MOP held in September, 2007, India initiated activities as early as 2008 and developed and launched the Roadmap for Phase-out of HCFCs in India in October, 2009 describing the long term vision and action plan. Since then, a number of activities have been carried out, including awareness workshops, collection and collation of data on consumption of HCFCs, preparation of sectoral strategies. UNDP on behalf of India prepared the HPMP Stage-I taking into account the sectoral strategies and availability of low-GWP technologies. The HPMP Stage-I was submitted to the MLF Secretariat for the consideration and approval of the 66th Ex-Com of the MLF for the Implementation of the Montreal Protocol with due approval of the MoEF&CC.

India's HPMP Stage-I was approved by Ex-Com in its 66th meeting held in April, 2012 for the period 2012-2015 to meet the 2013 and 2015 phase-out targets of HCFCs.

India successfully met the 2013 target of freeze of HCFC production and consumption and 10 % phase-out targets of HCFCs in 2015, as per the accelerated phase out schedule of the Montreal Protocol.

Through the HPMP Stage-I, a total of 341.77 ODP tonne of HCFCs have been phased out, of which 310.53 ODP tonne is of HCFC 141b in the foam manufacturing sector and 31.24 ODP tonne is for HCFC-22 in the RAC servicing sector, in accordance with the agreement between the Government of India and the Ex-Com of the MLF. The net direct emission reductions are thus 3,071,260.5 CO₂ eq.tonne.

HPMP Stage II

The 72nd meeting of the Ex-Com held in May, 2014 has approved the preparation of HPMP Stage-II for India with UNDP as the lead implementing agency in association with UN

Environment and GIZ, Proklima, Government of Germany as cooperating agencies.

HPMP Stage-II of India has been prepared for assisting the country in achieving compliance with the Montreal Protocol phase out target for consumption of HCFCs inter alia with complete phase-out of HCFC-141b, consumed exclusively in foam manufacturing sector. India's HPMP-II also includes activities that build on already implemented HPMP Stage-I activities.

The 77th meeting of the Ex-com held from 28th November to 2nd December, 2016 approved the HCFC Phase-out Management Plan (HPMP) Stage-II for India. Under HPMP II, India has secured 48.3 million USD from the Multilateral Fund including implementing agencies support cost for phasing out 8,190 MT or 769.49 ODP tonne of HCFC consumption between 2017 to 2023, in order to meet the compliance targets under Montreal Protocol for 2020. Around 400+ enterprises including 300+ Micro, Small and Medium Enterprises (MSMEs) in the foam manufacturing sector and 6 large air conditioning manufacturing enterprises would be supported under HPMP II for conversion from HCFCs to non-HCFC technologies."

India has voluntarily followed a low carbon development path in HPMP Stage II, while phasing out HCFCs by adopting non-ODS, low GWP and energy-efficient technologies in its HPMP, which is unlike growth paths taken by many countries in the developed world. The HPMP has been developed in a manner that industrial obsolescence and adverse economic impacts to the industry are minimized and the compliance targets of the Montreal Protocol are achieved.

India's HPMP has many unique initiatives both in the choice of conversion technologies adopted and in having a specific component on sector based policy development for phase out of HCFCs. The cross sectoral nature of HCFC phase-out activities has been recognized. Enabling Activities for policy development in energy

efficiency, green procurement, standard development for new HCFC alternatives, cold chain development, building sector will be undertaken.

Successful implementation of the HPMP Stage-II in India will result in a sustainable phase-out of 769.49 ODP tons of HCFCs. Due to the relatively high GWP of HCFCs, their phase-out will result in reduced direct GHG emissions. The net contribution towards reduction of direct CO₂ emissions due to successful implementation of HPMP Stage-II are 4,262,100 MT CO₂ Eq. per year from 2020 and 7,697,600 MT CO₂ Eq. per year from 2023.

The Ozone Depleting Substances (Regulation and Control) Rules, 2000 have been amended to align with the accelerated phase-out of HCFCs. The Ozone Depleting Substances (Regulation and Control) Amendment Rules, 2014 were published on 4th April, 2014 in the Gazette of India.

HFC - 23 incineration

India has taken a lead and issued an order for incinerating the HFC-23, a by-product of HCFC-22 refrigerant production, voluntarily by the producers of HCFC - 22. HFC-23 gas, a potent greenhouse gas, with GWP of 14800, is produced as a by-product of HCFC-22 manufacturing, and if vented out in environment, is a threat to the environment. India announced this step voluntarily without a commitment of financial support from the MLF, which shows the determination and commitment of the country on climate issues.

India Cooling Action Plan

Recognizing the cross cutting use of refrigeration and air conditioning technologies in various sectors and close linkage of energy efficiency with refrigerant transitions while phasing down HFCs, it has been decided to develop a India Cooling Action Plan. This plan would inter-alia integrate the phase out of ODSs/phase down of HFCs while maximizing

energy efficiency of air-conditioning equipment's.

The ICAP shall provide a perspective plan 20-year perspective plan (2018-2038) and policy recommendations, to address the cooling requirement across sectors while providing for ways and means to provide thermal comfort and access to sustainable cooling to all, involving multi-stakeholders to synergize actions for addressing cooling demand across all areas: technology, manufacturing, energy efficiency and the environment, while reemphasizing the principles enshrined in the Country Programme of India for phase out of ODS i.e. to have minimum economic dislocation and obsolescence cost and maximize indigenous production to twin environment and economic gains.

Given the cross-cutting nature of cooling demand, the ICAP implementation proposes active collaboration among the relevant ministries as well as the private sector entities. The draft ICAP will be launched on the World Ozone Day after which comments will be invited. The ICAP will be finalized after appropriately incorporating the comments.

Training and Certification of Refrigeration and Air-conditioning Service technicians under Skill India Mission

The Ozone Cell, MoEFCC had developed a project jointly with the Electronic Sector Skill Council of India (ESSCI) for upskilling and certifying 100,000 RAC service technicians under the Skill India Mission - Pradhan Mantri Kaushal Vikas Yojana (PMKVY) of Ministry of Skill development. Through this proposal not only the livelihood opportunities of the RAC service technicians working in the informal sector would be enhanced though upskilling and certification but most importantly this would have significant positive environmental impacts through reduction leakage of refrigerants and increase in the energy efficiency in the operation of RAC equipment.

A Memorandum of Understanding between the MoEF&CC and MSDE for implementing the project was signed by the Joint Secretaries of the two ministries during the launch function. Implementation of the project has begun.

Kigali Amendment

India provided strong political and policy leadership during the negotiations for the Kigali Amendment to the Montreal Protocol. The role of India was crucial in the adoption of the Kigali Amendment to the Montreal Protocol. The success of negotiations at Kigali is a result of the spirit of collective action, accommodation and flexibility by all the parties to ensure the best possible outcome which addresses the needs of all countries and leads to maximum climate benefits.

India piloted the concept of two base lines for the developing countries (group 1: 2020-2021-2022; China and others, and group 2: 2024-2025-2026; India and others) and a differentiated phased down time schedule to factor in the needs of developing countries. This was the first time in the Montreal Protocol that the concept of two baseline has been adopted both for developed and developing countries.

The freeze for the production and consumption of HFCs for India would be in 2028. The freeze year can be deferred to 2030 subject to technology review. In addition to production and consumption of HFCs in the baseline year, 65% of HCFC baseline has also been added to provide for adequate carbon space for the development of the country. India has undertaken to complete its phase down in 4 steps from 2032 onwards with cumulative reduction of 10% in 2032, 20% in 2037, 30% in 2042 and 85% in 2047. This agreement facilitates adequate carbon space for growth on domestic industry while minimizing the cost to the economy and consumers during the transition period.

On India's initiative, energy efficiency was

included for the first time in the Montreal Protocol as an agreed finance solution while phasing down HFCs. India provided strong political and policy leadership during the negotiations for the Kigali Amendment to the Montreal Protocol. Funding for R&D and servicing sector in developing countries has also been included in the agreed solutions on finance.

Estimated Climate Impact of Kigali Amendment by 2100

India has been able to secure an agreement that provides adequate space for growth of our economy, while providing adequate time for industry to shift to sustainable alternatives in the interest of environment. The agreed arrangements will minimize the cost to consumers in transitioning away from HFCs and provide for domestic innovation to develop in the sector of new generation refrigerants and related technologies.

Negotiations in Montreal Protocol Meetings

India actively participated in the deliberations on the cost guidelines and has in the 80th and 81st meetings, able to secure the incorporation of provision for adequate funding for energy efficiency and servicing sector in the negotiating text of the Cost Guidelines.

On India's initiative, it was agreed in 2016 at Kigali, Rwanda that the Multilateral Fund shall develop a cost guidance for maintaining or increasing the energy efficiency in the refrigeration and air conditioning equipment while making refrigerant transition while phasing down HFCs under the Montreal Protocol.

India was able to pilot after sustained and intensive negotiations the adoption Decision

XXIX/10 in the MOP emerging out of the CRP on the issues related to financial and technical support for energy efficiency in Article-5 Parties submitted by India and other proponents. This is a significant first step in operationalization of dovetailing energy efficiency and refrigerant transition under the Montreal Protocol framework, which will significantly enhance the overall climate benefit.

4. HOW CAN YOU HELP TO PROTECT THE OZONE LAYER?

"Being Ozone friendly" means taking individual action to reduce and eliminate impacts on the stratospheric ozone layer caused by the products that you buy, the appliances and equipment that your household or business uses, or the manufacturing process used by your company. Products made with, or containing ODSs such as CFCs, CTC, HCFCs, halons, methyl chloroform and methyl bromide can contribute to ozone layer depletion.

Actions that an individual can take to protect the ozone layer:

Be an Ozone-friendly consumer

Buy products (aerosol spray cans, refrigerators, air-conditioners, MDIs, fire extinguishers, etc.) that are labelled "ozone friendly" or "CFC free". The product labels should indicate that they do not contain ODSs such as CFCs or halons. Ask for more information from the seller to ensure that the product is ozone friendly. Tell your neighbour that you are the proud owner of "ozone friendly" products.

Be an ozone-friendly homeowner

Dispose of old refrigerators and appliances responsibly. CFC and HCFC refrigerants should be removed from an appliance before it is discarded. Portable halon fire extinguishers that are no longer needed should be returned to your fire protection authority for recycling. Consider purchasing new fire extinguishers that do not contain halon (e.g. dry powder) as recommended by your fire protection authority.

Be an ozone-friendly farmer

If you use methyl bromide for soil fumigation, consider switching to effective and safe alternatives that are currently being used in many countries to replace this ozone damaging

pesticide. Consider options such as integrated pest management that do not rely on costly chemical inputs. If you don't currently use methyl bromide, don't begin to use it now (you will have to get rid of it in the future).

Be an ozone-friendly refrigeration servicing Technician

Ensure that the refrigerant you recover from air conditioners, refrigerators or freezer during servicing is not "vented" or released to the atmosphere. Regularly check and fix leaks before they become a problem. Start refrigerant recovery and recycling programme in your area.

Be an ozone-friendly office worker

Help your company in identifying which of the existing equipments (e.g. water coolers, air-conditioners, cleaning solvents, fire extinguishers etc.) are based on ODSs. Develop a plan replacing them with cost-effective non-ODS based equipments/products. Become an environmental leader within your office.

Be an ozone-friendly company

Replace ODSs used in your premises and in your manufacturing processes. Contact your NOU to see if you are eligible for financial and technical assistance from the MLF. The products manufactured in your company are based on ODSs, plan and implement conversion of production line to non-ODSs technologies that do not destroy ozone layer.

Be an ozone-friendly teacher

Inform your students about the importance of protecting the environment and in particular, the ozone layer. Teach students about the damaging impact of ODSs on ozone layer, health and what steps are being taken internationally and nationally to solve this problem. Encourage

your students to spread the message to their families.

Be an ozone-friendly community organizer

Inform your family, neighbours and friends about the need to protect the ozone layer and help them get involved. Work with NGOs to help the community. Start information campaigns and technical assistance projects to phase out ODSs in your city, town or village.

Be an ozone-friendly citizen

Read and learn more about the effects of ozone depletion on people, animals and the environment. Also learn about your national strategy and policies to implement the Montreal Protocol and ODS phase-out program in your country. Get in touch with your country's NOU and learn how you can get involved on an individual level.

5. OZONE IN OUR ATMOSPHERE

Twenty Questions and Answers about the Ozone Layer

Q.1. : What is ozone and where is it in the atmosphere?

Ozone is a gas that is naturally present in our atmosphere. Each ozone molecule contains three atoms of oxygen and is denoted chemically as O₃. Ozone is found primarily in two regions of the atmosphere. About 10% of atmospheric ozone is in the troposphere, the region closest to Earth (from the surface to about 10-16 kilometers (6-10 miles)). The remaining ozone (about 90%) resides in the stratosphere between the top of the troposphere and about 50 kilometers (31 miles) altitude. The large amount of ozone in the stratosphere is often referred to as the "ozone layer."

Q.2. : How is ozone formed in the atmosphere?

Ozone is formed throughout the atmosphere in multistep chemical processes that require sunlight. In the stratosphere, the process begins with an oxygen molecule (O₂) being broken apart by UV radiation from the Sun. In the lower atmosphere (troposphere), ozone is formed by a different set of chemical reactions that involve naturally occurring gases and those from pollution sources.

Q.3. : Why do we care about atmospheric ozone?

Ozone in the stratosphere absorbs a

large part of the Sun's biologically harmful UV radiation. Stratospheric ozone is considered "good" ozone because of this beneficial role. In contrast, ozone formed at Earth's surface in excess of natural amounts is considered "bad" ozone because it is harmful to humans, plants, and animals. Natural ozone near the surface and in the lower atmosphere plays an important beneficial role in chemically removing pollutants from the atmosphere.

Q.4. : How is total ozone distributed over the globe?

The distribution of total ozone over the Earth varies with location on timescales that range from daily to seasonal. The variations are caused by large-scale movements of stratospheric air and the chemical production and destruction of ozone. Total ozone is generally lowest at the equator and highest in Polar Regions.

Q.5. : How is ozone measured in the atmosphere?

The amount of ozone in the atmosphere is measured by instruments on the ground and carried aloft on balloons, aircraft, and satellites. Some instruments measure ozone locally by continuously drawing air samples into a small detection chamber. Other instruments measure ozone remotely over long distances by using ozone's unique optical absorption or emission properties.

Q.6. : What are the principal steps in stratospheric ozone depletion caused by human activities?

The initial step in the depletion of stratospheric ozone by human activities is the emission, at Earth's surface, of gases containing chlorine and bromine. Most of these gases accumulate in the lower atmosphere because they are unreactive and do not dissolve readily in rain or snow. Natural air motions transport these accumulated gases to the stratosphere, where they are converted to more reactive gases. Some of these gases then participate in reactions that destroy ozone. Finally, when air returns to the lower atmosphere, these reactive chlorine and bromine gases are removed from Earth's atmosphere by rain and snow.

Q.7. : What emissions from human activities lead to ozone depletion?

Certain industrial processes and consumer products result in the emission of ODSs to the atmosphere. ODSs are manufactured halogen source gases that are controlled worldwide by the Montreal Protocol. These gases bring chlorine and bromine atoms to the stratosphere, where they destroy ozone in chemical reactions. Important examples are the CFCs, once used in almost all refrigeration and air conditioning systems, and the halons, which were used in fire extinguishers. Current ODS abundances in the atmosphere are known directly from air sample measurements.

Q.8. : What are the reactive halogen gases that destroy stratospheric ozone?

Emissions from human activities and

natural processes represent a large source of chlorine- and bromine containing gases that enter the stratosphere. When exposed to ultraviolet radiation from the Sun, these halogen source gases are converted to more reactive gases containing chlorine and bromine. Some reactive gases act as chemical reservoirs that convert to form the most reactive gases, namely chlorine monoxide (ClO) and bromine monoxide (BrO). The most reactive gases participate in catalytic reactions that efficiently destroy ozone. Most volcanoes emit some reactive halogen gases that readily dissolve in water and are usually washed out of the atmosphere before they can reach the stratosphere.

Q.9. : What are the chlorine and bromine reactions that destroy stratospheric ozone?

Reactive gases containing chlorine and bromine destroy stratospheric ozone in "catalytic" cycles made up of two or more separate reactions. As a result, a single chlorine or bromine atom can destroy many thousands of ozone molecules before it leaves the stratosphere. In this way, a small amount of reactive chlorine or bromine has a large impact on the ozone layer. A special situation develops in Polar Regions in the late winter/early spring season where large enhancements in the abundance of the most reactive gas, chlorine monoxide, leads to severe ozone depletion.

Q.10. : Why has an "ozone hole" appeared over Antarctica when ODSs are present throughout the stratosphere?

ODSs are present throughout the

stratospheric ozone layer because they are transported great distances by atmospheric air motions. The severe depletion of the Antarctic ozone layer known as the "ozone hole" occurs because of the special atmospheric and chemical conditions that exist there and nowhere else on the globe. The very low winter temperatures in the Antarctic stratosphere cause polar stratospheric clouds (PSCs) to form. Special reactions that occur on PSCs, combined with the relative isolation of polar stratospheric air, allow chlorine and bromine reactions to produce the ozone hole in Antarctic springtime.

Q.11.: How severe is the depletion of the Antarctic ozone layer?

Severe depletion of the Antarctic ozone layer was first reported in the mid-1980s. Antarctic ozone depletion is seasonal, occurring primarily in late winter and early spring (August-November). Peak depletion occurs in early October when ozone is often completely destroyed over a range of altitudes, thereby reducing total ozone by as much as two-thirds at some locations. This severe depletion creates the "ozone hole" apparent in images of Antarctic total ozone made using satellite observations. In most years the maximum area of the ozone hole far exceeds the size of the Antarctic continent.

Q.12.: Is there depletion of the Arctic ozone layer?

Yes, significant depletion of the Arctic ozone layer now occurs in most years in the late winter/early spring period (January-March). However, the maximum depletion is less severe than

that observed in the Antarctic and is more variable from year to year. A large and recurrent "ozone hole," as found in the Antarctic stratosphere, does not occur in the Arctic.

Q.13.: How large is the depletion of the global ozone layer?

Depletion of the global ozone layer began gradually in the 1980s and reached a maximum of about 5% in the early 1990s. The depletion has lessened since then and now is about 3.5% averaged over the globe. The average depletion exceeds the natural year-to-year variations of global total ozone. The ozone loss is very small near the equator and increases with latitude toward the poles. The larger polar depletion is attributed to the late winter/early spring ozone destruction that occurs there each year.

Q.14.: Do changes in the Sun and volcanic eruptions affect the ozone layer?

Yes, factors such as changes in solar radiation, as well as the formation of stratospheric particles after volcanic eruptions, do influence the ozone layer. However, neither factor can explain the average decreases observed in global total ozone over the last three decades. If large volcanic eruptions occur in the coming decades, ozone depletion will increase for several years afterwards.

Q.15.: Are there controls on the production of ODSs?

Yes, the production and consumption of ODSs are controlled under a 1987 international agreement known as the "Montreal Protocol on Substances that Deplete the Ozone Layer" and by its

subsequent Amendments and Adjustments. The Protocol, now ratified by all 197 United Nations members, establishes legally binding controls on national production and consumption of ODSs. Production and consumption of all principal ODSs by developed and developing nations will be almost completely phased out before the middle of the 21st century.

Q.16.: Has the Montreal Protocol been successful in reducing ODSs in the atmosphere?

Yes, as a result of the Montreal Protocol, the overall abundance of ODSs in the atmosphere has been decreasing for about a decade. If the nations of the world continue to comply with the provisions of the Montreal Protocol, the decrease will continue throughout the 21st century. Those gases that are still increasing in the atmosphere, such as halon-1301 and HCFC-22, will begin to decrease in the coming decades if compliance with the Protocol continues. Only after midcentury will the effective abundance of ODSs fall to values that were present before the Antarctic ozone hole was observed in the early 1980s.

Q.17.: Does depletion of the ozone layer increase ground-level UV radiation?

Yes, UV radiation at Earth's surface increases as the amount of overhead total ozone decreases, because ozone absorbs UV radiation from the Sun. Measurements by ground-based instruments and estimates made using satellite data provide evidence that surface ultraviolet radiation has increased in large geographic regions in response to ozone depletion.

Q.18.: Is depletion of the ozone layer the principal cause of climate change?

No, ozone depletion itself is not the principal cause of climate change. Changes in ozone and climate are directly linked because ozone absorbs solar radiation and is also a greenhouse gas. Stratospheric ozone depletion and increases in global tropospheric ozone that have occurred in recent decades have opposing contributions to climate change. The ozone-depletion contribution, while leading to surface cooling, is small compared with the contribution from all other greenhouse gas increases, which leads to surface warming. The total forcing from these other greenhouse gases is the principal cause of observed and projected climate change. Ozone depletion and climate change are indirectly linked because both ODSs and their substitutes are greenhouse gases.

Q.19.: Have reductions of ODSs under the Montreal Protocol also protected Earth's climate?

Yes. All ODSs are also greenhouse gases that contribute to climate forcing when they accumulate in the atmosphere.

Montreal Protocol controls have led to a substantial reduction in the emissions of ODSs over the last two decades. These reductions have provided the added benefit of reducing the human contribution to climate change while protecting the ozone layer. Without Montreal Protocol controls, the climate forcing contribution from annual ODS emissions could now be 10-fold larger than its present value, which would be a significant fraction of the climate forcing from current CO₂ emissions.

Q.20.: How is ozone expected to change in the coming decades?

Substantial recovery of the ozone layer from the effects of ODSs is expected near the middle of the 21st century, assuming global compliance with the Montreal Protocol. Recovery will occur as ODSs and reactive halogen gases in the stratosphere decrease in the coming

decades. In addition to responding to ODSs, future ozone amounts will increasingly be influenced by expected changes in climate. The resulting changes in stratospheric ozone will depend strongly on the geographic region. During the long recovery period, large volcanic eruptions could temporarily reduce global ozone amounts for several years.

Release of "The Montreal Protocol: India's Success Story" on the occasion of 30th Anniversary of the Montreal Protocol and 23rd World Ozone Day" on 16th September, 2017 at New Delhi, India.

Release of "Poster" on the occasion of 30th Anniversary of the Montreal Protocol and 23rd World Ozone Day" on 16th September, 2017 at New Delhi, India.

Award Winning Students on the occasion of 30th Anniversary of the Montreal Protocol and 23rd World Ozone Day" on 16th September, 2017 at New Delhi, India.

Dr. Harsh Vardhan, Hon'ble Minister for Environment, Forest & Climate Change, Government of India visiting "Industry Exhibition organized on the occasion of 30th Anniversary of the Montreal Protocol and 23rd World Ozone Day" on 16th September, 2017 at New Delhi, India.

Dr. Harsh Vardhan, Hon'ble Minister for Environment, Forest & Climate Change, Government of India, officers of the Ministries, representatives of GIZ and RAC Service Sector Association are also present at the stall of Refrigeration & Air-conditioning Servicing Sector Society (RASSS) in "Industry Exhibition" held on the occasion of 30th Anniversary of the Montreal Protocol and 23rd World Ozone Day" on 16th September, 2017 at New Delhi, India.

Shri Anil Kumar Jain, Additional Secretary, Ministry of Environment, Forest & Climate Change, Government of India addressing the participants during the "Stakeholder Consultation National Cooling Action Plan" held on 17th January, 2018 at New Delhi, India.

Participants attending the "Stakeholder Consultation National Cooling Action Plan" held on 17th January, 2018 at New Delhi, India.

Dr. Harsh Vardhan, Hon'ble Minister for Environment, Forest & Climate Change, Government of India and Mr. Erik Solheim, Executive Director, UN Environment, inaugurating Joint stall of Ozone Cell, Ministry of Environment, Forest and Climate Change, Government of India, UNDP, UNEP and GIZ "ACREX India - 2018" Exhibition held from 22nd to 24th February, 2018 at Bangalore.

Joint stall of Ozone Cell, Ministry of Environment, Forest and Climate Change, Government of India, UNDP, UNEP and GIZ in "ACREX India Exhibition 2018" on 22nd to 24th February, 2018 at Bangalore.

Shri Gyanesh Bharti, the then Joint Secretary, Ministry of Environment, Forest and Climate Change, Government of India addressing the participants during workshop on Energy Efficient and Climate-Friendly HVAC&R Technology in India at ACREX India 2018 at Bangalore.

Dr. Harsh Vardhan, Hon'ble Minister for Environment, Forest & Climate Change, Government of India addressing the participants during Signing of Memorandum of Understanding for joint project on Upskilling Air-Conditioner service Technicians under Recognition of Prior learning (RPL) component of under the Pradhan Mantri Kaushal Vikas Yojana, in the presence of Shri Dharmendra Pradhan, Hon'ble Minister for Skill Development and Entrepreneurship, Government of India on 2nd August 2018.

Shri Dharmendra Pradhan, Hon'ble Minister for Skill Development and Entrepreneurship, Government of India addressing the participants during Signing of Memorandum of Understanding for joint project on Upskilling Air-Conditioner service Technicians under Recognition of Prior learning (RPL) component of under the Pradhan Mantri Kaushal Vikas Yojana, in the presence of Dr. Harsh Vardhan, Hon'ble Minister for Environment, Forest & Climate Change, Government of India on 2nd August 2018.

Signing of Memorandum of Understanding for joint project on Upskilling Air-Conditioner service Technicians under Recognition of Prior learning (RPL) component of under the Pradhan Mantri Kaushal Vikas Yojana between Ministry of Environment, Forest and Climate Change and Ministry of Skill Development and Entrepreneurship on 2nd August 2018, in the presence of Dr. Harsh Vardhan, Hon'ble Minister for Environment, Forest & Climate Change and Shri Dharmendra Pradhan, Hon'ble Minister for Skill Development and Entrepreneurship.

Dr. Harsh Vardhan, Hon'ble Minister for Environment, Forest & Climate Change, Government of India and Shri Dharmendra Pradhan, Hon'ble Minister for Skill Development and Entrepreneurship, Government of India and Dr. Mahesh Sharma, Minister of State for Ministry of Environment, Forest & Climate Change, Government of India during Signing of Memorandum of Understanding for joint project on Upskilling Air-Conditioner service Technicians under Recognition of Prior learning (RPL) component of under the Pradhan Mantri Kaushal Vikas Yojana on 2nd August 2018.

Dr. Mahesh Sharma, Minister of State for Ministry of Environment, Forest & Climate Change, Government of India visited the Ozone Cell, MoEF&CC stall during World Environment Day Exhibition 2018 at Delhi.

Stall of Ozone Cell, Ministry of Environment, Forest and Climate Change, Government of India, at the World Environment Day Exhibition, 2018 on 02nd to 05th June, 2018, India Gate lawns at Delhi.

On behalf of India, the award was received by Shri C.K. Mishra, Secretary, Ministry of Environment, Forest, and Climate Change. The Award ceremony was held in Montreal during the first day of high level segment of 29th Meeting of Parties to the Montreal Protocol.

Shri C.K. Mishra, Secretary, Ministry of Environment, Forest, and Climate Change participating in Ministerial Round table organized during the high level segment of the 29th Meeting of Parties to the Montreal Protocol held on 23rd November, 2017.

The poster features logos for the 30th Anniversary of the Montreal Protocol, UN Environment, and the Government of India. It includes a line graph showing 'Surface temperature change by 2100' with three scenarios: 'Business as usual (RCP8.5)', 'Kigali amendment (2016)', and 'Kigali amendment (2017)'. The Kigali amendment scenarios show significantly lower temperature increases compared to the business as usual scenario. The event details are: 23rd November 2017, 1:00pm-2:00pm, Room No. 5, ICAD Building.

Side event An Integrated Approach to cooling: Maximising Climate Benefits under Kigali Amendment during the High level segment of 29th Meeting of Parties to the Montreal Protocol held on 23rd November, 2017.
